Group Rings Crossed Products And Galois Theory:

Group Rings, Crossed Products, and Galois Theory Donald S. Passman, 1986 For readers with a basic graduate level background in algebra these ten articles provide a readable introduction to three major interrelated subjects of noncommutative algebra The theme is the interplay between group theory and ring theory dealing specifically with group rings crossed products and the Galois theory of rings The author has carefully included most definitions to keep the required background minimal Furthermore each article contains a selection of results on the given topic a limited number of proofs or sketches and at least a few open problems The Algebraic Structure of Crossed Products G. Karpilovsky, 1987-05-01 In the past 15 years the theory of crossed products has enjoyed a period of vigorous development The foundations have been strengthened and reorganized from new points of view especially from the viewpoint of graded rings The purpose of this monograph is to give in a self contained manner an up to date account of various aspects of this development in an effort to convey a comprehensive picture of the current state of the subject It is assumed that the reader has had the equivalent of a standard first year graduate course thus familiarity with basic ring theoretic and group theoretic concepts and an understanding of elementary properties of modules tensor products and fields A chapter on algebraic preliminaries is included which briefly surveys topics required later in the book Groups, Rings and Algebras Donald S. Passman, William Chin, James Osterburg, Declan Patrick Francis Quinn, 2006 This is a companion volume to the conference in honor of Donald S Passman held in Madison Wisconsin in June 2005 It contains research papers on Algebras Group Rings Hopf Algebras Invariant Theory Lie Algebras and their Enveloping Algebras Noncommutative Algebraic Geometry Noncommutative Rings and other topics The papers represent an important part of the latest research in these areas **Methods of Graded Rings** Constantin Nastasescu, Freddy van Oystaeyen, 2004-02-07 The topic of this book graded algebra has developed in the past decade to a vast subject with new applications in noncommutative geometry and physics Classical aspects relating to group actions and gradings have been complemented by new insights stemming from Hopf algebra theory Old and new methods are presented in full detail and in a self contained way Graduate students as well as researchers in algebra geometry will find in this book a useful toolbox Exercises with hints for solution provide a direct link to recent research publications The book is suitable for courses on Master level or textbook for seminars Galois Theory, Hopf Algebras, and Semiabelian Categories George Janelidze, 2004 This volume is based on talks given at the Workshop on Categorical Structures for Descent and Galois Theory Hopf Algebras and Semiabelian Categories held at The Fields Institute for Research in Mathematical Sciences Toronto ON Canada The meeting brought together researchers working in these interrelated areas This collection of survey and research papers gives an up to date account of the many current connections among Galois theories Hopf algebras and semiabelian categories. The book features articles by leading researchers on a wide range of themes specifically abstract Galois theory Hopf algebras and categorical structures in particular quantum categories and higher dimensional structures

Articles are suitable for graduate students and researchers specifically those interested in Galois theory and Hopf algebras The Algebraic Structure of Group Rings Donald S. Passman, 2011-01-01 Highly and their categorical unification recommended by the Bulletin of the London Mathematical Society this book offers a comprehensive self contained treatment of group rings The subject involves the intersection of two essentially different disciplines group theory and ring theory The Bulletin of the American Mathematical Society hailed this treatment as a majestic account proclaiming it encyclopedic and Algebraic Analysis of Solvable Lattice Models Michio Jimbo, Tetsuji Miwa, 1995 Based on the NSF CBMS Regional Conference lectures presented by Miwa in June 1993 this book surveys recent developments in the interplay between solvable lattice models in statistical mechanics and representation theory of quantum affine algebras Because results in this subject were scattered in the literature this book fills the need for a systematic account focusing attention on fundamentals without assuming prior knowledge about lattice models or representation theory After a brief account of basic principles in statistical mechanics the authors discuss the standard subjects concerning solvable lattice models in statistical mechanics the main examples being the spin 1 2 XXZ chain and the six vertex model The book goes on to introduce the main objects of study the corner transfer matrices and the vertex operators and discusses some of their aspects from the viewpoint of physics Once the physical motivations are in place the authors return to the mathematics covering the Frenkel Jing bosonization of a certain module formulas for the vertex operators using bosons the role of representation theory and correlation functions and form factors The limit of the XXX model is briefly discussed and the book closes with a discussion of Homological Dimensions of Modules Barbara L. Osofsky, 1973-12-31 Features other types of models and related works notes that were prepared for a series of ten lectures given at Regional Conference of the Conference Board of the Mathematical Sciences in June 1971 This title also includes a derivation of Tor one step at a time without the usual derived functor machinery Subfactors and Knots Vaughan F. R. Jones, This book is based on a set of lectures presented by the author at the NSF CBMS Regional Conference Applications of Operator Algebras to Knot Theory and Mathematical Physics held at the US Naval Academy in Annapolis in June 1988 The audience consisted of low dimensional topologists and operator algebraists so the speaker attempted to make the material comprehensible to both groups He provides an extensive introduction to the theory of von Neumann algebras and to knot theory and braid groups The presentation follows the historical development of the theory of subfactors and the ensuing applications to knot theory including full proofs of some of the major results The author treats in detail the Homfly and Kauffman polynomials introduces statistical mechanical methods on knot diagrams and attempts an analogy with conformal field theory Written by one of the foremost mathematicians of the day this book will give readers an appreciation of the unexpected interconnections between different parts of mathematics and physics Classification of Subfactors and Their Endomorphisms Sorin Popa, 1995 This monograph provides a more unifed and self contained presentation of the results presented in Popa's earlier papers on this topic Classifications of

Subfactors and Their Endomorphisms is based on lectures presented by Popa at the NSF CBMS Regional Conference held in **Lectures on Division Algebras** David J. Saltman, 1999 This volume is based on lectures Eugene Oregon in August 1993 on division algebras given at a conference held at Colorado State University Although division algebras are a very classical object this book presents this classical material in a new way highlighting current approaches and new theorems and illuminating the connections with a variety of areas in mathematics **Selected Topics in the Geometrical Study of Differential Equations** . Nonlinear Wave Equations Walter A. Strauss, 1990-01-12 The theory of nonlinear wave equations in the absence of shocks began in the 1960s Despite a great deal of recent activity in this area some major issues remain unsolved such as sharp conditions for the global existence of solutions with arbitrary initial data and the global phase portrait in the presence of periodic solutions and traveling waves This book based on lectures presented by the author at George Mason University in January 1989 seeks to present the sharpest results to date in this area. The author surveys the fundamental qualitative properties of the solutions of nonlinear wave equations in the absence of boundaries and shocks These properties include the existence and regularity of global solutions strong and weak singularities asymptotic properties scattering theory and stability of solitary waves Wave equations of hyperbolic Schrodinger and KdV type are discussed as well as the Yang Mills and the Vlasov Maxwell equations The book offers readers a broad overview of the field and an understanding of the most recent developments as well as the status of some important unsolved problems Intended for mathematicians and physicists interested in nonlinear waves this book would be suitable as the basis for an advanced Lectures on Hilbert Cube Manifolds Thomas A. Chapman, 1976 The goal of these lectures is to graduate level course present an introduction to the geometric topology of the Hilbert cube Q and separable metric manifolds modeled on Q which are called here Hilbert cube manifolds or Q manifolds In the past ten years there has been a great deal of research on Q and Q manifolds which is scattered throughout several papers in the literature The author presents here a self contained treatment of only a few of these results in the hope that it will stimulate further interest in this area No new material is presented here and no attempt has been made to be complete For example the author has omitted the important theorem of Schori West stating that the hyperspace of closed subsets of 0 1 is homeomorphic to Q In an appendix prepared independently by R D Anderson D W Curtis R Schori and G Kozlowski there is a list of problems which are of current interest This includes problems on Q manifolds as well as manifolds modeled on various linear spaces. The reader is referred to this for a much broader perspective of the field In the first four chapters the basic tools which are needed in all of the remaining chapters are presented Beyond this there seem to be at least two possible courses of action The reader who is interested only in the triangulation and classification of Q manifolds should read straight through avoiding only Chapter VI In particular the topological invariance of Whitehead torsion appears in Section 38 The reader who is interested in R D Edwards recent proof that every ANR is a Q manifold factor should read the first four chapters and then with the single exception of 26 1 skip over

to Chapters XIII and XIV Metrics, Connections and Gluing Theorems Clifford Taubes, 1996 In this book the author s goal is to provide an introduction to some of the analytic underpinnings for the geometry of anti self duality in 4 dimensions Anti self duality is rather special to 4 dimensions and the imposition of this condition on curvatures of connections on vector bundles and on curvatures of Riemannian metrics has resulted in some spectacular mathematics. The book reviews some basic geometry but is is assumed that the reader has a general background in differential geometry as would be obtained by reading a standard text on the subject Some of the fundamental references include Atiyah Hitchin and Singer Freed and Uhlenbeck Donaldson and Kronheimer and Kronheimer and Mrowka The last chapter contains open problems and Isolated Invariant Sets and the Morse Index Charles C. Conley,1978-12-31 This volume contains lectures conjectures from the Conference Board of Mathematical Sciences meeting held at the University of Colorado on May 31 June 4 1976 The lectures consist of an expository discussion of basic results for topological flows and a somewhat more detailed discussion of isolated invariant sets and continuation The construction of the index for isolated invariant sets is new and allows more general application than previous ones Also the index itself is endowed with more structure and the continuation theorem is modified to take this new structure into account Some elementary applications are given but the main emphasis is on the Dynamics in Several Complex Variables John Erik Fornæss, 1996 This CBMS lecture series held in Albany New York in June 1994 aimed to introduce the audience to the literature on complex dynamics in higher dimension Some of the lectures are updated versions of earlier lectures given jointly with Nessim Sibony in Montreal 1993 the authro's intent in this book is to give an expansion of the Montreal lectures basing complex dynamics in higher dimension systematically on pluripotential theory **Tight Closure and Its Applications** Craig Huneke, 1996 This monograph deals with the theory of tight closure and its applications The contents are based on ten talks given at a CBMS conference held at North Dakota State University in June 1995 Weak Convergence Methods for Nonlinear Partial Differential Equations Lawrence C. Evans, 1990 Expository lectures from the CBMS Regional Conference held at Loyola University of Chicago June 27 July 1 1988 T p verso Geometric Analysis and Function Spaces Steven George Krantz, 1993 This book brings into focus the synergistic interaction between analysis and geometry by examining a variety of topics in function theory real analysis harmonic analysis several complex variables and group actions Krantz's approach is motivated by examples both classical and modern which highlight the symbiotic relationship between analysis and geometry Creating a synthesis among a host of different topics this book is useful to researchers in geometry and analysis and may be of interest to physicists astronomers and engineers in certain areas The book is based on lectures presented at an NSF CBMS Regional Conference held in May 1992
