Hematopoietic Growth Factors in Oncology Gary Lyman,David C. Dale,2010-11-05 Progress in the treatment of cancer over the past two decades has been rapid with many new and novel therapeutic modalities arriving at an unprecedented pace Overall cancer mortality rates have actually begun to fall in parallel with progress in the diagnosis and treatment of malignant disease Despite our advances in the understanding of the biology and molecular genetics of cancer as well as the availability of an increasing array of effective therapies cancer treatment today and for the foreseeable future will include the traditional modalities of surgery radiation therapy and chemotherapy Myelosuppressive agents with their potential hematopoietic toxicities remain the mainstay of systemic treatment for both metastatic and early stage cancer The complications of cancer chemotherapy have serious impact on a patient s well being and overall quality of life Fortunately advances in cancer treatment have been accompanied by equally impressive progress in the availability of a wide array of supportive care modalities which have greatly enhanced the ability of oncologists to minimize the impact of cancer and its treatment on patient quality of life as well improve delivery of potentially curative cancer treatment Despite the increasing complexity of modern cancer treatment it is the obligation of the oncologist as well as the entire cancer care team to be certain that cancer patients receive the optimal supportive care available for their disease and its treatment Among the most serious and potentially life threatening toxicities of cancer treatment are the hematologic toxicities accompanying myelosuppression including anemia and associated asthenia and fatigue neutropenia and fever associated with infection in the immunocompromised patient and thrombocytopenia and accompanying risk of bleeding Special supportive care needs

arise in the very elderly care patient that may tax the ability of even the most skilled clinician Despite the considerable progress that has been made with more effective and safer treatment strategies myelosuppressive chemotherapy will remain the mainstay of systemic treatment for cancer for the foreseeable future While considerable progress has occurred better methods and broader application of supportive care measures are needed to reduce the symptomatic effects of cancer and the associated toxicities associated with cancer treatment No area of cancer supportive care better illustrates the progress that has resulted from advances in our understanding of cellular and molecular biology genetic engineering and the development of more effective yet often more toxic cancer treatments than that of the hematopoietic growth factors This volume will review and integrate the major advances in our understanding of the underlying molecular biology and pharmacology of these agents along with the results of well designed and executed randomized controlled trials of the erythroid stimulating agents the myeloid growth factors and the new thrombopoietic agents each addressing a major threat associated with bone marrow suppression accompanying cancer treatment The current clinical utilization of these agents is based on numerous randomized controlled trials and meta analyses along with evidence based clinical practice guidelines developed by professional societies guiding their appropriate and cost effective use in clinical care **Hematopoietic Cell**

Clinical Applications of Cytokines and Growth Factors John R. Wingard, George D. Demetri, 2012-12-06 The hematopoietic system plays roles that are crucial for survival of the host delivery of oxygen to tissues arrest of accidental blood leaking from blood vessels and fending off of invading microbes by humoral cell mediated and phagocytic immunity The activity of the hematopoietic system is staggering daily a normal adult produces approximately 2.5 billion erythrocytes 2.5 billion platelets and 1 billion granulocytes per kilogram of body weight This production is adjusted in a timely fashion to changes in actual needs and can vary from nearly none to many times the normal rate depending on needs which vary from day to day or even minute to minute In response to a variety of stimuli the cellular components of the blood are promptly increased or decreased in production to maintain appropriate numbers to optimally protect the host from hypoxia infection and hemorrhage How does this all happen and happen without over or under responding There has been extraordinary growth in our understanding of hematopoiesis over the last two decades Occupying center stage is the pluripotent stem cell and its progeny Hematopoietic stem cells have been characterized by their capacity for self renewal and their ability to proliferate and differentiate along multiple lineages Few in number the stem cell gives rise to all circulating neutrophils erythrocytes lymphoid cells and platelets In hematopoietic transplantation the stem cell is capable of restoring long term hematopoiesis in a lethally irradiated host
