Negative Strand Rna Virus Ming Luo,2011-08-05 Negative strand RNA viruses have a unique mechanism of replication Their genome is a single strand RNA that has to be transcribed as soon as the virus enters the host in order to carry out viral replication As a result a viral specific RNA polymerase is packaged in the virion and is ready for transcription after virus entry This novel replication mechanism dictates the assembly and RNA synthesis of negative strand RNA viruses In recent years many discoveries have been made with regard to the entry replication and assembly of this class of viruses This book will present updated coverage of the fundamental knowledge about negative strand RNA viruses

Studies in Viral Ecology, Volume 2 Christon J. Hurst,2011-08-23 This book explains the ecology of viruses by examining their interactive dynamics with their hosting species in this volume in animals including the types of transmission cycles that viruses have evolved encompassing principal and alternate hosts vehicles and vectoring species Examining virology from an organismal biology approach and focusing on the concept that viral infections represent areas of overlap in the ecologies of the involved species Viral Ecology is essential for students and professionals who either may be non virologists or virologists whose previous familiarity has been very specialized

Vaccinia Virus and Poxvirology Stuart N. Isaacs,2008-02-03 The Right Book at the Right Time The poxviruses comprise a family of complex DNA viruses that replicate in the cytoplasm of vertebrate or invertebrate cells Of the eight recognized genera of vertebrate poxviruses those belonging to the orthopoxvirus genus have been most intensively studied This group includes variola virus the agent of smallpox as well as cowpox virus and vaccinia virus Jenner's original smallpox vaccine described in 1798 consisted of live cowpox virus but vaccinia virus later replaced it 1 There has been speculation as to the origin of vaccinia virus the most likely idea is that it is a separate species possibly originally isolated from a horse and is now extinct or rare in nature 2 Recent genome sequencing studies confirm the distinctness of variola virus cowpox virus and vaccinia virus and also their very close genetic relationship which accounts for the cross protection of smallpox vaccines The novelty of the smallpox vaccine can be readily appreciated by the time it took about 80 years before the next live vaccine against rabies was developed and another 50 years for the yellow fever vaccine Moreover the eradication of smallpox in 1977 stands as a unique medical achievement Because of its historical role smallpox vaccination contributed greatly to present concepts of infectious disease immunity and pathogenesis Less well known

however are the many other firsts for vaccinia virus **Retroviruses, retroelements and their restrictions** Atsushi Koito, Yukihiro Ishizaka, 2015-05-01 Human retroviruses HIV and HTLV have been recognized as important pathogens because of their association with lethal diseases such as AIDS and ATL. Considerable resources and efforts have been directed at understanding the interaction between these retroviruses and their host which may provide clues as to how the infection can be controlled or prevented. Among the key scientific successes is the identification of intracellular restriction factors that have evolved as obstacles to the replication of pathogens including infectious retroviruses. The discovery of APOBEC which are strong mutagens of retroviral genomes and intracellular retroelements began a new era of intense research activities into the spectrum of intrinsic anti HIV activity leading to the identification of TRIM5a, BST2, Tetherin and SAMHD1. In response, HIV has evolved several accessory genes as weaponries to evade these intracellular restriction activities. The intracellular antiretroviral defenses evolved in response to endogenous retroelements that make up more than 40% of the entire mammalian genome and which are regarded as ancestors of infectious retroviruses. LTR type retroelements are present in all higher eukaryotes representing about 8% of the human genome. Non LTR retroelements can be found at extremely high copy numbers also with a significant portion of mammalian genomes consisting of LINEs. Mammalian genomes are modified by LINEs through insertions but also by the indirect replication of non autonomous retrotransposons such as SINEs. LINEs insertion was shown to have played and continue to play important roles in genomic evolution and somatic genome mosaicism mediated physiology. And because retrotransposition can confer genetic diversity that is beneficial to the host, the vertebrate intrinsic immunity has evolved to support a balance between retroelement insertions that confer beneficial and those that cause deleterious gene disruptions. The articles published in this Research Topic should serve not only as valuable references for the field but provide future topics of research for investigators that should further our understanding of the retrovirus retroelements and their restrictions **Antibiotic Essentials 2010** Burke A.
