

IBM Storage Area Network and Fibre Array Storage Technology

Central management, access and storage for business-critical information

Executive Summary

A storage area network (SAN) is a separate network that enables disk and tape storage to be isolated from the local area network (LAN). A SAN allows for improved security, reliability and management of a company's critical data. The benefits of a SAN can be achieved without having an impact on the company's primary communication network. A SAN using IBM Fibre Array Storage Technology (FAS/T) is a dedicated Fibre Channel (FC) infrastructure of servers and their adapters, external storage devices, hubs, switches and network and storage management tools.

IBM has developed a core set of products to help address the growing SAN market. This IBM initiative is designed to help customers manage, track and more easily share the ever-increasing volume of data being created by e-business applications. The IBM SAN initiative will also help customers manage their technology resources—application servers, storage servers, network hardware and storage management software—virtually anywhere, anytime and share information across storage networks regardless of the vendor that supplies the systems and applications. SAN technology can lead to lower total cost of ownership by allowing storage resources to be consolidated and shared by several servers.

Several factors are making the ability to manage resources and share information crucial. Among them are the growth of data-intensive applications such as data warehousing, data mining and enterprise resource planning. Add to this the increasing presence of the Internet, e-business applications and the need for companies to be open for business 24 hours a day, 7 days a week, in multiple time zones—and around-the-clock access to business data becomes almost essential. In this environment, data storage is rapidly becoming a central component of corporate technology strategies.

A SAN addresses many of the critical business issues, including data backup and recovery procedures that can slow operations and affect end users across the enterprise network and, ultimately, potentially affect a company's profitability. The SAN allows data-intensive storage processing without disrupting network operations. IBM FAS/T SAN solutions include the hardware components to build the SAN best suited to your needs and the software tools to help you fully exploit a SAN in your business. Further, through IBM Global Services, IBM offers the resources to analyze your current storage solution and to install and maintain your SAN.

This paper gives an overview of the IBM @server xSeries SAN strategy. Because of the dynamic nature of the computer industry, changes may occur in the actual implementation and timing of product announcements.
