Intelligent Systems      **System Analysis and Modeling** Daniel Amyot, Alan W. Williams, 2005-01-27 This book constitutes the thoroughly refereed postproceedings of the 4th International Workshop on SDL and MSC SAM 2004 held in Ottawa Canada in June 2004 The 19 revised full papers presented were carefully selected during two rounds of reviewing and revision from initially 46 submissions The papers are organized in topical sections on SDL and eODL evolution of languages requirements and MSC security SDL and modeling and experience      Industrial Communication Technology Handbook Richard Zurawski, 2017-12-19 Featuring contributions from major technology vendors industry consortia and government and private research establishments the Industrial Communication Technology Handbook Second Edition provides comprehensive and authoritative coverage of wire and wireless based specialized communication networks used in plant and factory automation automotive applications avionics building automation energy and power systems train applications and more New to the Second Edition 46 brand new chapters and 21 substantially revised chapters Inclusion of the latest most significant developments in specialized communication technologies and systems Addition of new application domains for specialized networks The Industrial Communication Technology Handbook Second Edition supplies readers with a thorough understanding of the application specific requirements for communication services and their supporting technologies It is useful to a broad spectrum of professionals involved in the conception design development standardization and use of specialized communication networks as well as academic institutions engaged in engineering education and vocational training      **Model-Driven Development of Reliable Automotive Services** Manfred Broy, Ingolf Krüger, Michael Meisinger, 2008-07-17 Software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions so close to the customer Ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software The numbers of serious accidents have declined in recent years despite constantly increasing traffic this is correlated with the introduction of advanced software enabled functionality for driver assistance such as electronic stability control Software contributes significantly to the automotive value chain By 2010 it is estimated that software will make up 40% of the value creation of automotive electronics However with the large number of software enabled functions their interactions and the corresponding networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at runtime A central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units ECUs and the associated networks As an example consider the central locking systems CLS whose functionality is spread out over up to 19 different ECUs in some luxury cars Of course this includes advanced functionality such as seat positioning and radio tuning according to driver presets upon entry as well as unlocking in case of a detected impact or accident However this example demonstrates that modern automotive systems bridge comfort and safety critical functionality This induces particular demands on safety and security and in general software and systems quality The resulting challenges and

opportunities were discussed in depth at the second Automotive Software Workshop San Diego ASWSD 2006 on whose results we report here
