Economic Control Of A Renewable Resource Under Sole Ownership:

The Economic Control of a Renewable Resource Under Sole Ownership C. Michael Wernerheim, 1989 The objective of this thesis is twofold First it examines optimal investment problems arising in renewable resource sectors such as forestry where important externalities are attached to the growing stock and where investment in the resource the biomass and application of capital and labour the harvesting capacity must be considered simultaneously Second a general framework for empirical analysis is developed to analyze logging production under profit maximization and when externalities are attached to the standing forest Taxation regimes and quantitative control policies to correct for market failure in forestry are examined The analytical solution is characterized by dynamic bioeconomic golden rule equations A generalized dynamic Faustmann Ohlin rule is derived for the case when more than one type of harvesting method is used This is a new theoretical feature of the approach explicated here obtained of optimal harvest rates stock levels site values and other information of relevance to forest policy Efficiency implications of current forestry legislation and taxation are assessed The utility of the estimated model for practical forest management is also demonstrated Although applied to forestry the approach is readily amendable to renewable management in general efficient forest management does not appear to be in conflict with the intent of Swedish forestry legislation

Vincent, Janislaw M. Skowronski, 2013-03-08 As society becomes stressed by economic and population pressures in turn nature s renewable resources become stressed by harvesting pressures For our own survival and euphoria it is paramount that such resources remain as their name implies and not be driven to extinction through short term programs of over exploitation Consideration of the harvesting of renewable resources leads to a simple question that was the theme of the workshop and is the focus of these proceedings SUPPoRe you are assigned the role of manager for a specific renewable resource eco system How would you decide on harvesting policies so that the system can be exploited economically yet at the same time maintain the integrity of the system This of course is a loaded question First of all it is not clear that there is ever anyone single decision maker who is able to set the rules for all of the harvesters in an exploited ecosystem The political process is complicated and to some extent unpredictable This aspect of the question is recognized to be important but could not be addressed here Assuming then that someone really is in charge what would be involved in the decision making process As Clark points out there is no alternative but first to model the system We agree However if the original question was loaded modeling is the adulterate The Evolution of Resource Property Rights Anthony Scott, 2008-03-27 This book traces the development of the standard property rights over five kinds of natural resource inland rivers ocean fisheries petroleum resources gold and base metals and forest resources from classical times through to the

empirical issues in the valuation of environmental and natural resources the relationships between economic growth natural resources and environmental quality re evaluation of some standard results in the dynamic modeling of renewable and non renewable resources the protection and management of biological resources and the economics of antibiotic resistance The original papers within this book will be of great interest to academics and practitioners in the field of environmental and natural resource economics

Essays on the Economics of Migratory Fish Stocks Ragnar Arnason, Trond Bjørndal, 2012-12-06 Following the publication of seminal papers by professors H S Gordon in 1954 and A D Scott in 1955 active research has led to rapid progress in our understanding of the economics of fisheries Fishing however is a complicated activity involving intricate interactions between man made fishing capital and naturally produced fish stocks in an inherently dynamic and stochastic setting Consequently in spite of significant advances important sections of fisheries economics remain largely unexplored One such area is the economics of migratory fish stocks In 1985 the editors of this volume embarked on a research project concerned with the optimal utilization of common Nordic fish stocks A fundamental feature of some of the most important of these fish stocks such as the Atlanto Scandian herring and the Icelandic capelin is their migratory behaviour Not only do the migrations continuously alter the economic conditions for harvesting these species They also result in the periodical transfer of stock concentrations from one exclusive fisheries jurisdictions to another It was readily apparent that this behaviour constituted a crucial determinant of the appropriate harvesting pattern of these stocks More importantly however migrations are by no means a unique feature of Nordic fish stocks In fact it appears that migratory behaviour is exhibited albeit in varying degrees by all species of fish It therefore stands to reason that migrations constitute an important aspect of the economics of fisheries in general
