

Cracks in the Crust

Every year approximately a million earthquakes occur, many of them on the ocean floor. Whether minor or major, earthquakes usually occur along cracks in the earth's crust called faults. But, whenever they happen, most earthquakes produce enough or slight people are not even aware of them.

One of the most destructive earthquakes ever recorded took place in Lisbon, Portugal, on November 1, 1755. It was felt by people as far north as Iceland and as far south as Morocco, as far east as Sicily and as far west as the West Indies.

Faults

One of the biggest, and best-known, faults is the San Andreas Fault that runs through California and into northern Mexico. After the terrible San Francisco earthquake of 1906, scientists found that land on one side of the fault had slipped sharply past land on the other side. Roads that once crossed the fault were no longer connected; the pavement on one side of the fault had been carried up to 21 feet away!

Flying over California, you can actually see the San Andreas Fault. This giant scar, some 650 miles long, clearly marks the border between the Pacific Plate and the North American Plate.

In the fall of 1989 part of the Pacific Plate suddenly slipped about 6 feet past the North American Plate. This happened 11 miles deep in the crust, beneath Loma Prieta, California. The earthquake struck just before a World Series game in San Francisco. The stadium, Candlestick Park, suffered little harm because it was built on rock. Structures built on soil or mud were damaged the most. Earthquakes cause these materials to shift more than rocks.

Predicting Earthquakes

In 1975 and 1976 Chinese scientists successfully predicted three earthquakes. One clue that seemed to herald a quake was odd behavior in animals: cows, horses, and pigs racing about for no apparent reason, or snakes slithering out of holes.

In 1975 nearly thousand people were warned to leave the Chinese city of Haicheng just before it was destroyed by a major earthquake. In 1976, however, one of the worst earthquakes of modern times struck Tangshan, China, killing more than two hundred forty thousand people! For every successful prediction, ten false alarms have been issued.

Seismologists, who study earthquakes, have confirmed several warning signs called precursors. While odd animal behavior is one, it is not much help, because it often comes just minutes before an earthquake strikes. More reliable precursors include a rise or drop in the water level of wells, a swarm of small earthquakes, and an increase in hydrogen gas in the soil.

In 1983 seismologists measured a sharp rise of hydrogen near faults in central California. This precursor was soon followed by a strong earthquake near Coalinga.
