Elementary Mechanics Of Plastic Flow In Metal Forming:

Elementary Mechanics of Plastic Flow in Metal Forming Samuel H. Talbert, Betzalel Avitzur, 1996-06-03 Metal forming plasticity is an advanced subject of intensive current research relevant to both materials science and mechanical engineering. It is used for the analysis and modelling of fabrication processes such as forging, extrusion, rolling, wire and tube drawing. The fundamentals of flow mechanics are explained here before they are applied in a variety of machine tool design engineering situations. These fundamentals form the basis of all engineering analyses of the plastic flow in metal forming and are essential to all students of engineering. Worked examples showing the variety of metal forming situations and approximately 200 end of chapter problems are also included. [Fundamentals Of Materials Modelling For Metals Processing Technologies: Theories And Applications](#) Jianguo Lin, 2015-03-24 This book provides a comprehensive introduction to the unique theory developed over years of research on materials and process modelling and its application in metal forming technologies. It starts with the introduction of fundamental theories on the mechanics of materials, computational mechanics and the formulation of unified constitutive equations. Particular attention is paid to elastic plastic formulations for cold metal forming and unified elastic viscoplastic constitutive equations for warm hot metals processing. Damage in metal forming and numerical techniques to solve and determine the unified constitutive equations are also detailed. Examples are given for the application of the unified theories to solve practical problems encountered in metal forming processes. This is particularly useful to predict microstructure evolution in warm hot metal forming processes. Crystal plasticity theories and modelling techniques with their applications in micro forming are also introduced in the book. The book is self contained and unified in presentation. The explanations are highlighted to capture the interest of curious readers and complete enough to provide the necessary background material to further explore, develop new theories and applications. **Applied Mechanics Reviews**, 1974 *Elasticity and Plasticity of Large Deformations* Albrecht Bertram, 2008-08-03 This book is based on the lecture notes of courses given by the author over the last decade at the Otto von Guericke University of Magdeburg and the Technical University of Berlin. Since the author is concerned with researching material theory and in particular elasto plasticity, these courses were intended to bring the students close to the frontiers of today's knowledge in this particular field, an opportunity now offered also to the reader. The reader should be familiar with vectors and matrices and with the basics of calculus and analysis. Concerning mechanics, the book starts right from the beginning without assuming much knowledge of the subject. Hence the text should be generally comprehensible to all engineers, physicists, mathematicians and others. At the beginning of each new section, a brief comment on the literature contains recommendations for further reading. Throughout the text, we quote only the important contributions to the subject matter. We are far from being complete or exhaustive in our references and we apologise to any colleagues not mentioned in spite of their important contributions to the particular items. Theory of Metal Forming Plasticity Andrzej Sluzalec, 2013-04-17 The intention of this book is to reveal and discuss some aspects of the metal forming plasticity theory The modern theory describes deformation of metallic bodies in cold and hot regimes under combined thermal and mechanical loadings Thermal and deformation fields appear in metal forming in various forms A thermal field influences the material properties modifies the extent of plastic zones etc and the deformation of metallic body induces changes in temperature distribution The thermal effects in metal forming plasticity can be studied at two levels pending on whether uncoupled or coupled theories of thermo plastic response have to be applied A majority of metal forming processes can be satisfactorily studied within an uncoupled theory In such an approach the temperature enters the stress strain relation through the material constants and through the thermal dilatation The description of thermo plastic deformation in metal forming is carried out on the ground of thermodynamics

Modelling of Metal Forming Processes J.L. Chenot, E. Oñate, 2012-12-06 The physical modelling of metal forming processes has been widely used both in University and in Industry for many years Relatively simple numerical models such as the Slab Method and the Upper Bound Method were first used and many such models are implemented in the industry for practical design or regulation of forming processes These are also under investigation in the University mainly for treatment models which require low cost calculations or very fast answers for on line integration More recently sophisticated numerical methods have been used for the simulation of metal flow during forming operations

Since the early works in 1973 and 1974 mainly in U K and U S A the applications of the finite element method to metal processing have been developed in many laboratories all over the world Now the numerical approach seems to be widely recognized as a powerful tool for comprehension oriented studies for predicting the main technological parameters and for the design and the optimization of new forming sequences There is also a very recent trend for the introduction of physical laws in the thermo mechanical models in order to predict the local evolution of internal variable representing the micro structure of the metal To day more and more practitioners of the Industry are asking for computer models for design of their forming processes

Dynamic Models for Structural Plasticity William J. Stronge,Tongxi Yu,2012-12-06 Our topic is irreversible or plastic deformation of structural elements composed of relatively thin ductile materials These deformations are commonly used in sheet metal forming operations to produce lightweight parts of any particular shape In another context this type of plastic deformation is described as impact damage in the case of structural components involved in collision Here we are concerned with mechanics of both static and dynamic deformation processes The purpose is to use typical material properties and structural characteristics to calculate the deformation for certain types of load in particular to find the final deflection and shape of the deformed structure and to illustrate how the development of this final shape depends on the constitutive model used to represent the material behavior The major issue to be addressed is which structural and constitutive properties are important for calculating response to either static or brief but intense dynamic loads Furthermore how do the results of various constitutive models compare with observed behavior Metal Forming
