Elliptic Second Order Partial Differential Equations Gabriel R. Barrenechea,Volker John,Petr Knobloch,2025-03-18 This book offers a comprehensive presentation of numerical methods for elliptic boundary value problems that satisfy discrete maximum principles DMPs The satisfaction of DMPs ensures that numerical solutions possess physically admissible values which is of utmost importance in numerous applications A general framework for the proofs of monotonicity and discrete maximum principles is developed for both linear and nonlinear discretizations Starting with the Poisson problem the focus is on convection diffusion reaction problems with dominant convection a situation which leads to a numerical problem with multi scale character The emphasis of this book is on finite element methods where classical usually linear and modern nonlinear discretizations are presented in a unified way In addition popular finite difference and finite volume methods are discussed Besides DMPs other important properties of the methods like convergence are studied Proofs are presented step by step allowing readers to understand the analytic techniques more easily Numerical examples illustrate the behavior of the methods **Numerical and Symbolic Scientific Computing** Ulrich Langer,Peter Paule,2011-11-19 The book presents the

state of the art and results and also includes articles pointing to future developments Most of the articles center around the theme of linear partial differential equations Major aspects are fast solvers in elastoplasticity symbolic analysis for boundary problems symbolic treatment of operators computer algebra and finite element methods a symbolic approach to finite difference schemes cylindrical algebraic decomposition and local Fourier analysis and white noise analysis for stochastic partial differential equations Further numerical symbolic topics range from applied and computational geometry to computer algebra methods used for total variation energy minimization **Computation and Applied Mathematics** ,1991

Guaranteed Computational Methods for Self-Adjoint Differential Eigenvalue Problems Xuefeng Liu,2024-06-25 This monograph presents a study of newly developed guaranteed computational methodologies for eigenvalue problems of self adjoint differential operators It focuses on deriving explicit lower and upper bounds for eigenvalues as well as explicit estimations for eigenfunction approximations Such explicit error estimations rely on the finite element method FEM along with a new theory of explicit quantitative error estimation diverging from traditional studies that primarily focus on qualitative results To achieve quantitative error estimation the monograph begins with an extensive analysis of the hypercircle method that is the Prager Synge theorem It introduces a novel a priori error estimation technique based on the hypercircle method This facilitates the explicit estimation of Galerkin projection errors for equations such as Poisson s and Stokes which are crucial for obtaining lower eigenvalue bounds via conforming FEMs A thorough exploration of the fundamental theory of projection based explicit lower eigenvalue bounds under a general setting of eigenvalue problems is also offered This theory is extensively detailed when applied to model eigenvalue problems associated with the Laplace biharmonic Stokes and Steklov differential operators which are solved by either conforming or non conforming FEMs Moreover there is a detailed discussion on the Lehmann Goerisch theorem for the purpose of high precision eigenvalue bounds showing its relationship with previously established theorems such as Lehmann Maehly s method and Kato s bound The implementation details of this theorem with FEMs a topic rarely covered in existing literature are also clarified Lastly the monograph introduces three new algorithms to estimate eigenfunction approximation errors revealing the potency of classical theorems Algorithm I extends Birkhoff s result that works for simple eigenvalues to handle clustered eigenvalues while Algorithm II generalizes the Davis Kahan theorem initially designed for strongly formulated eigenvalue problems to address weakly formulated eigenvalue problems Algorithm III utilizes the explicit Galerkin projection error estimation to efficiently handle Galerkin projection based approximations
