

Chapter 4 Concepts of Psychobiology

- The **frontal lobe** may play a role in the emotional experience, as evidenced by changes in mood and character after damage to this area. The frontal lobe may also be involved (indirectly through association fibers linked to primary sensory areas) in thinking and perceptual interpretation of information.
- The alterations include fear, aggressiveness, depression, rage, euphoria, irritability, and apathy and are likely related to a frontal lobe connection to the limbic system.
- The **limbic system** sometimes called the "emotional brain" is associated with feelings of fear and anxiety; anger and aggression; love, joy, and hope; and with sexuality and social behavior.

The Nervous System

- **Neurotransmitters** are chemicals that convey information across synaptic clefts to neighboring target cells.
- Neurotransmitters play an important role in human emotions and behavior and are the target for the mechanism of action in many psychotropic medications.
- Many neurotransmitters exist in the central and peripheral nervous systems, but only a limited number have implications for psychiatry.
- **Major categories of neurotransmitters**
 - **Cholinergic** - acetylcholine
 - **Monoamines** - norepinephrine, dopamine, serotonin, histamine
 - **Amino acids** - *Inhibitory:* GABA, glycine
-*Excitatory:* glutamate, aspartate
 - **Neuropeptides** - opioid, substance P, somatostatin

James M. Sprague, Alan N. Epstein, 2013-10-22 Progress in Psychobiology and Physiological Psychology Volume 9 reviews developments in the fields of psychobiology and physiological psychology with emphasis on selected areas of research relating brain mechanisms and behavior Topics covered range from sensory perceptual systems in mammals to behavioral modulation of visual responses in monkeys Brain pathways for vocal learning in birds are also examined along with neural mechanisms in taste aversion learning Comprised of seven chapters this volume begins with an insightful account of the evolution of concepts regarding cortical organization relevant to perception in mammals Studies of single unit activity in awake behaving monkeys are then presented followed by a discussion on the neural control of song in birds In particular the brain pathways involved in vocal learning in birds are defined anatomically and physiologically including the presence of hemispheric dominance and the sensitivity to steroid hormones Subsequent chapters focus on the response characteristics of the cells in the forebrain that give stimuli their significance for associative learning the neuropsychological mechanisms of taste aversion learning and the psychobiology of thirst The final chapter is devoted to the pineal gland and its anatomical connection to the eyes together with pineal hormones polypeptides and proteins This book should appeal to biologists

psychologists and physiologists **The Psychobiology of Mind** William R. Uttal, 2014-06-27 Originally published in 1978 this book develops a conceptual synthesis of the field of physiological psychology the science specifically concerned with the relationship between the brain and the mind It was designed to elucidate the important questions under investigation the basic intellectual and technical problems that were encountered and the significance of the major empirical results of the time Of equal or even greater importance is the author's derivation of the general principles relating brain and mind that had emerged after decades of modern research into this important question Included in the volume are historical and philosophical perspectives on the mind brain problem as well as extensive discussions of instruments methodology empirical findings and theory Here is a powerful heuristic tool that informs the reader about the concepts and ideas implicit in this science rather than simply exhaustively listing experimental results The author does not ignore findings he organizes them into three broad categories localization representation and learning then emphasizes the relationships among experiments

This is a book that synthesizes integrates and stresses concepts principles and problems The careful organization of the book makes it especially useful for students of brain and mind at all levels **Issues in Psychobiology** Charles R.

Legg,2016-07-15 At the time of original publication psychobiology was one of the most rapidly developing areas of psychology Its growth owed much to recent advances both in techniques for studying the physiological bases of behaviour and in major conceptual advances in the way people thought about the brain First published in 1989 this textbook introduction to the field looks at the state of psychobiology in the light of these advances The issues covered include the factors that have shaped the current state of the field the value of animal subjects in the study of psychological processes the problems of studying the brain including the theoretical assumptions underlying the most widely used methods the current status of influential theories like Stellar s 2 center theory of motivation and Papez s theory of emotion the relationship between psychological theory and physiological data such as recent accounts of the visual system the problems presented by emergent properties like consciousness **Progress in Psychobiology and Physiological Psychology** Alan N.

Epstein,Adrian R.
