Nassehi, D. B. Das, 2007-01-01 This book provides concise up to date and easy to follow information on an increasingly important area of hydro environmental analysis and management It covers important aspects of both surface and subsurface water quality management as they are inseparable components of aquifers and the flow in physical domains occur in combination with the other However the main emphasis of the book is on the practical development and application of computer based algorithms via appropriate schemes to realistic problems Mathematical theories are not discussed as they can be found in many expert books All sections of the book include detailed descriptions of practical examples It also uniquely gives explanations regarding the formulation of practical management schedules and tools for hydro environmental systems There is a lack of books dealing with the practical aspects of the application of computer modelling techniques to complex hydrodynamical phenomena and this book has been written for professionals and researchers especially those who are not trained mathematicians who nevertheless need to make managerial decisions *Computational Methods in the Management of Hydro Environmental Systems* will be an invaluable source of information for post graduate level researchers and decision makers who need to apply numerical modelling techniques to investigate hydrodynamic phenomena and pollutants dispersion in natural aquatic systems Professionals and engineers who now need to gain insights about the working of computer techniques for choosing appropriate schemes and applying them to realistic problems will also value this work Masters level and final year graduate students are also expected to benefit from the book

**Numerical Modelling of Hydrodynamics for Water Resources** Pilar Garcia Navarro, Enrique Playán, 2007-11-01  
Overland flow modelling has been an active field of research for some years but developments in numerical methods and computational resources have recently accelerated progress producing models for different geometries and types of flows such as simulations of canal and river networks Flow in canals has traditionally been described using one dimensional depth averaged shallow water models but a variety of simulation techniques now facilitate the management of hydrodynamic systems providing models which incorporate complex geometry and diverse flows Much effort has gone into elaborating canal operational rules based on decision support systems with the dual aim of assuring water delivery and meeting flow control constraints In natural water courses water management problems are associated with the need to meet quality standards Numerical modelling of advection diffusion can be used to manage problems related to the movement of solutes in rivers and aquifers The analysis of solute transport is used to safeguard the quality of surface and ground water and to help prevent eutrophication Solute flow through the soil can be dynamically linked to overland flow for hydrological and agricultural applications Advances in modelling also cast new light on sediment transport in rivers exploring the complex dynamics of river bed erosion and deposition and assist in the analysis of river reservoir systems All these issues are discussed in Numerical Modelling of Hydrodynamics for Water Resources which will be useful to civil engineers applied
