## **Effects Of Air Pollution On The Built Environment:**

*The Effects Of Air Pollution On The Built Environment* Peter Brimblecombe, 2003-04-08 Air pollution damages materials but it has changed dramatically in the past century with a reduction in the concentration of corrosive primary pollutants in urban atmospheres At the same time architectural styles and types of materials have changed as we have moved to more organically rich photochemically active atmospheres Contemporary air pollutants have the potential to degrade organic coatings and polymers which are of great importance to modern structures while increasing amounts of fine diesel soot spoil the simple lines and smooth areas characteristic of many modern buildings This book examines a range of materials discussing the ways in which they are likely to be damaged by air pollutants It should be of interest to scientists and policymakers dealing with the effects of urban air pollution

Built environments are complex emergent systems and require contextual analysis. They should be understood before reconsidering how professionals and researchers of the built environment are educated and trained to reduce the gap between knowledge practice and real world circumstances. There is an urgent need to rethink the role of policy makers, researchers, practitioners and laypeople in the construction, renovation and reuse of the built environment in order to deal with numerous environmental, ecological, economic, financial and social ethical challenges of providing a habitat for current and future generations in a world of continual change. These challenges are too complex to be dealt with only by one discipline or profession. Combinations of different types of knowledge, knowing in praxis and tacit knowledge are needed. This book presents and illustrates recent innovative contributions with case studies focusing on five strategic domains and the interrelations between them. These transdisciplinary contributions apply concepts, methods and tools that facilitate convergence and concerted action between participants collaborating in policy definition and project implementation. The methods and tools include experiments in living labs, prototypes on site and virtual simulations as well as participatory approaches including citizen science, the development of alternative scenarios and visioning plausible futures.

**Microbiomes of the Built Environment** National Academies of Sciences, Engineering, and Medicine, National Academy of Engineering, Division on Engineering and Physical Sciences, Health and Medicine Division, Division on Earth and Life Studies, Board on Infrastructure and the Constructed Environment, Board on Environmental Studies and Toxicology, Board on Life Sciences, Committee on Microbiomes of the Built Environment: From Research to Application, 2017-11-06

People's desire to understand the environments in which they live is a natural one. People spend most of their time in spaces and structures designed, built and managed by humans and it is estimated that people in developed countries now spend 90 percent of their lives indoors. As people move from homes to workplaces, traveling in cars and on transit systems, microorganisms are continually with and around them. The human-associated microbes that are shed along with the human behaviors that affect their transport and removal make significant contributions to the diversity of the indoor microbiome. The characteristics of healthy indoor environments cannot yet be defined nor do microbial clinical and building researchers yet understand how to modify features of indoor environments such as building ventilation systems and the chemistry of building materials in ways that would have predictable impacts on microbial communities to promote health and prevent disease. The factors that affect the environments within buildings, the ways in which building characteristics influence the composition and function of indoor microbial communities and the ways in which these microbial communities relate to human health and well-being are extraordinarily complex and can be explored only as a dynamic interconnected ecosystem by engaging the fields of microbial biology and ecology, chemistry, building science and human physiology. This report reviews what is known about the intersection of these disciplines and how new tools may facilitate advances in understanding the

ecosystem of built environments indoor microbiomes and effects on human health and well being It offers a research agenda to generate the information needed so that stakeholders with an interest in understanding the impacts of built environments will be able to make more informed decisions
