**Individual-based Modeling and Ecology** Volker Grimm, Steven F. Railsback, 2013-11-28 Individual based models are an exciting and widely used new tool for ecology These computational models allow scientists to explore the mechanisms through which population and ecosystem ecology arises from how individuals interact with each other and their environment This book provides the first in depth treatment of individual based modeling and its use to develop theoretical understanding of how ecological systems work an approach the authors call individual based ecology Grimm and Railsback start with a general primer on modeling how to design models that are as simple as possible while still allowing specific problems to be solved and how to move efficiently through a cycle of pattern oriented model design implementation and analysis Next they address the problems of theory and conceptual framework for individual based ecology What is theory That is how do we develop reusable models of how system dynamics arise from characteristics of individuals What conceptual framework do we use when the classical differential equation framework no longer applies An extensive review illustrates the ecological problems that have been addressed with individual based models The authors then identify how the mechanics of building and using individual based models differ from those of traditional science and provide guidance on formulating programming and analyzing models This book will be helpful to ecologists interested in modeling and to other scientists interested in agent based modeling

*Long-Term Forest Dynamics of the Temperate Zone* Paul A. Delcourt, Hazel R. Delcourt, 2012-12-06 The synthesis presented in this volume is a direct outgrowth of our ten year FORMAP Project Forest Mapping Across Eastern North America from 20 000 yr B P to the Present Many previous research efforts in paleoecology have used plant fossil evidence as proxy information for primarily geologic or climatic reconstructions or as a bio stratigraphic basis for correlation of regional events In contrast in this book we deal with ecological questions that require a holistic perspective that integrates the interactions of biota with their dynamically changing environments over time scales up to tens of thousands of years In the FORMAP Project our major research objective has been to use late Quaternary plant ecological data sets to evaluate long term patterns and processes in forest development In order to accomplish this objective we have prepared subcontinent scale calibrations that quantitatively relate the production and dispersal of arboreal pollen to dominance in the vegetation for the major tree types of eastern North America Quantification of pollen vegetation relationships provides a basis for developing quantitative plant ecological data sets that allow further ecological analysis of both individual taxa and forest communities through time Application of these calibrations to fossil pollen records for interpreting forest history thus represents a fundamental step beyond traditional summaries based upon pollen percentages

*Integrated Coastal Zone Management of Coral Reefs* Kent Gustavson, Richard M. Huber, H. Jack Ruitenbeek, 2000 The applied research indicates that to improve awareness park education programs should be targeted specifically to the user groups primarily through outreach programs Further the Park's management programs should be highlighted particularly the beneficial tangible products and services benefits the Park provides to each user group The closer the tie between reef conditions and business earnings the greater the users support for reef conservation Coral reefs are sometimes referred to as canaries of the sea because of their early warning ability to show near shore oceanic stress Because of their biological diversity they are also called rainforests of the sea Coral reefs are vital to the well being of millions of people Coral reef managers and government officials trying to save their valuable national resources have turned to research on coral reefs for help The research presented in this publication merits a great deal of notice because the output is useful for decision support and training tools in integrated coastal zone management ICZM The work on cost effectiveness analysis has developed integrated economic and ecological models relying extensively on fuzzy logic procedures to model impacts and effects of interventions within the reef environment By contrast the marine system valuation work provides economic valuations of coral reefs demonstrating the use of different modeling methods and treating key policy issues within this context This publication will interest coastal zone experts and managers worldwide
