*Advances in Optimization and Decision Science for Society, Services and Enterprises* Massimo Paolucci, Anna Sciomachen, Pierpaolo Uberti, 2020-01-25 The contributions

included in the volume are drawn from presentations at ODS2019 International Conference on Optimization and Decision Science which was the 49th annual meeting of the Italian Operations Research Society AIRO held at Genoa Italy on 4-7 September 2019. This book presents very recent results in the field of Optimization and Decision Science. While the book is addressed primarily to the Operations Research OR community, the interdisciplinary contents ensure that it will also be of very high interest for scholars and researchers from many scientific disciplines including computer sciences, economics, mathematics, and engineering. Operations Research is known as the discipline of optimization applied to real world problems and to complex decision making fields. The focus is on mathematical and quantitative methods aimed at determining optimal or near optimal solutions in acceptable computation times. This volume not only presents theoretical results but also covers real industrial applications, making it interesting for practitioners facing decision problems in logistics, manufacturing, production, and services. Readers will accordingly find innovative ideas from both a methodological and an applied perspective.

**Data Mining and Mathematical Programming** Panos M. Pardalos, Pierre Hansen, 2008-04-09. Data mining aims at finding interesting, useful, or profitable information in very large databases. The enormous increase in the size of available scientific and commercial databases, data avalanche, as well as the continuing and exponential growth in performance of present day computers, make data mining a very active field. In many cases, the burgeoning volume of data sets has grown so large that it threatens to overwhelm rather than enlighten scientists. Therefore, traditional methods are revised and streamlined, complemented by many new methods to address challenging new problems. Mathematical Programming plays a key role in this endeavor. It helps us to formulate precise objectives, e.g., a clustering criterion or a measure of discrimination, as well as the constraints imposed on the solution, e.g., find a partition, a covering, or a hierarchy in clustering. It also provides powerful mathematical tools to build highly performing exact or approximate algorithms. This book is based on lectures presented at the workshop on Data Mining and Mathematical Programming, October 10-13, 2006, Montreal, and will be a valuable scientific source of information to faculty, students, and researchers in optimization, data analysis, and data mining, as well as people working in computer science, engineering, and applied mathematics.

Optimization and Decision Science Raffaele Cerulli, Mauro Dell'Amico, Francesca Guerriero, Dario Pacciarelli, Antonio Sforza, 2022-01-03. This book collects selected contributions from the international conference Optimization and Decision Science ODS2020 which was held online on November 19, 2020, and organized by AIRO, the Italian Operations Research Society. The book offers new and original contributions on optimization, decision science, and prescriptive analytics from both a methodological and applied perspective, using models and methods based on continuous and discrete optimization, graph theory, and network optimization, analytics, multiple criteria decision making, heuristics, metaheuristics, and exact methods. In addition to more theoretical contributions, the book chapters describe models and

methods for addressing a wide diversity of real world applications spanning health transportation logistics public sector manufacturing and emergency management Although the book is aimed primarily at researchers and PhD students in the Operations Research community the interdisciplinary content makes it interesting for practitioners facing complex decision making problems in the afore mentioned areas as well as for scholars and researchers from other disciplines including artificial intelligence computer sciences economics mathematics and engineering

*Implicit Functions and Solution Mappings* Asen L. Dontchev, R. Tyrrell Rockafellar, 2014-06-18 The implicit function theorem is one of the most important theorems in analysis and its many variants are basic tools in partial differential equations and numerical analysis This second edition of *Implicit Functions and Solution Mappings* presents an updated and more complete picture of the field by including solutions of problems that have been solved since the first edition was published and places old and new results in a broader perspective The purpose of this self contained work is to provide a reference on the topic and to provide a unified collection of a number of results which are currently scattered throughout the literature Updates to this edition include new sections in almost all chapters new exercises and examples updated commentaries to chapters and an enlarged index and references section

*Robust Resource Allocation in Future Wireless Networks* Saeedeh Parsaeefard, Ahmad Reza Sharafat, Nader Mokari, 2017-03-06 This book presents state of the art research on robust resource allocation in current and future wireless networks The authors describe the nominal resource allocation problems in wireless networks and explain why introducing robustness in such networks is desirable Then depending on the objectives of the problem namely maximizing the social utility or the per user utility cooperative or competitive approaches are explained and their corresponding robust problems are considered in detail For each approach the costs and benefits of robust schemes are discussed and the algorithms for reducing their costs and improving their benefits are presented Considering the fact that such problems are inherently non convex and intractable a taxonomy of different relaxation techniques is presented and applications of such techniques are shown via several examples throughout the book Finally the authors argue that resource allocation continues to be an important issue in future wireless networks and propose specific problems for future research

*Simulation of Flow in Porous Media* Peter Bastian, Johannes Kraus, Robert Scheichl, Mary Wheeler, 2013-07-31 Subsurface flow problems are inherently multiscale in space due to the large variability of material properties and in time due to the coupling of many different physical processes such as advection diffusion reaction and phase exchange Subsurface flow models still need considerable development For example nonequilibrium effects entrapped air anomalous dispersion and hysteresis effects can still not be adequately described Moreover parameters of the models are difficult to access and often uncertain

Computational issues in subsurface flows include the treatment of strong heterogeneities and anisotropies in the models the efficient solution of transport reaction problems with many species treatment of multiphase multicomponent flows and the coupling of subsurface flow models to surface flow models given by shallow water or Stokes equations With respect to energy

and the environment in particular the modelling and simulation of radioactive waste management and sequestration of CO<sub>2</sub> underground have gained high interest in the community in recent years Both applications provide unique challenges ranging from modelling of clay materials to treating very large scale models with high performance computing This book brings together key numerical mathematicians whose interest is in the analysis and computation of multiscale subsurface flow and practitioners from engineering and industry whose interest is in the applications of these core problems
