**Progress in Polymer Degradation and Stability Research** Herbert W. Moeller, 2007-06-11  
 Polymer degradation is a change in the properties, tensile strength, colour, shape etc of a polymer or polymer based product under the influence of one or more environmental factors such as heat, light or chemicals. These changes may be undesirable such as changes during use or desirable as in biodegradation or deliberately lowering the molecular weight of a polymer. Such changes occur primarily because of the effect of these factors on the chemical composition of the polymer. In a finished product such a change is to be prevented or delayed. However, the degradation process can be useful from the viewpoints of understanding the structure of a polymer or recycling/reusing the polymer waste to prevent or reduce environmental pollution. Polymers/molecules are very large on the molecular scale which derive their unique and useful properties from their size.
