Experiments are reported that demonstrate current-perpendicular-to-the-plane giant magnetoresistance devices can be switched repeatedly between the high- and low-resistance states by passing current vertically through the structure. The lithographically patterned devices, having diameters in the range of 0.3–0.7 μm , operate at room temperature and exhibit distinctly separate switching of the soft and hard layers. Designs for magnetoelectronic random access memory can utilize this scheme for storing and reading information. © 1999 American Institute of Physics. [S0003-6951(99)04642-2]

Since the discovery of the giant magnetoresistance (GMR) effect in 1988,¹ there have been several successful technological applications including field sensors² and recording read heads,³ as well as the demonstration of elements for random access memory (RAM).⁴ All of these applications exploit the current-in-plane (CIP) GMR effect in which the current used to sense the magnetoresistance is propagated parallel to the interfaces of the multilayered planar structure. An alternative approach that propagates the current perpendicular to the planes (CPP) was first demonstrated in 1991 (Ref. 5) and showed a GMR effect some five times larger than the CIP effect for a similarly structured magnetic metal multilayer. Application of the CPP-GMR effect, which we shall refer to as vertical GMR devices, is much more challenging since the vertical devices have very low resistance unless they are fabricated to have small cross-sectional areas. No applications have yet been reported for vertical GMR devices.

Although there have been reports^{6,7} of the effects of driving current through magnetic multilayers, in this letter we report experiments that demonstrate vertical GMR devices can be switched between the high- and low-resistance states by passing current through the device. We interpret our results to indicate the hard and soft magnetic layers form circularly oriented magnetizations that can be switched between parallel and antiparallel helicity using the magnetic field generated by the current through the device. These results, obtained at room temperature on lithographically patterned devices, can be fruitfully applied to the development of vertical GMR devices in magnetoelectronic random access memory. We note particularly the control of the circular magnetization by current-through-device switching is unique to the CPP geometry and leads to a dipole-free magnetic-field configuration of the remanent device magnetization that allows for a more stable quiescent state relative to linearly polarized devices.

GMR structures were patterned from rf-diode sputtered

metal multilayers. The metal sequence for this work was Si / SiN / 40 Ta / 1500 Cu / 7 Ta / 20 Cu / (23 NiFeCo / 40 Cu / 12 NiFe / 40 Cu)₅ / 1000 Cu / 1500 SiN (thickness units are Å). The base SiN (silicon nitride) is grown by low-pressure chemical-vapor deposition on (100) Si wafers. The capping nitride serves as a protective layer and as a subsequent hard mask. It is deposited using reactive sputtering of Si in an Ar/N₂ atmosphere. Ta is used as both an adhesion layer and as a phase-breaking layer that reduces the grain size of the magnetic metals. Small grain-size materials reduce the influence of magnetocrystalline anisotropy allowing lower coercive fields to be obtained on unpatterned films.⁸

Devices were patterned using the process flow shown in Fig. 1. The metallized wafer is first patterned to the device level with optical lithography to a minimum feature size of 0.6 μm using a mold-UV contact printer. CF₄/4% O₂ reactive ion etching (RIE) followed by a photoresist strip in acetone defines the hard mask features in the top nitride. Electron-beam lithography using polymethyl methacrylate (PMMA) combined with a second RIE is used to reduce the size of the optically defined features to below 0.6 μm . Following an

The abbreviations are defined as: top terminal copper (TTCu); bottom terminal copper (BTCu); photolithography/reactive ion etch/ion-beam etch/silicon nitride deposition (Photo/RIE/RIE/Nitride Dep); silicon nitride chemical-mechanical polishing (Nitride CMP); copper deposition/top lead definition (Copper Dep/Top Lead Def'n).
