Ginzburglandau Phase Transition Theory And Superconductivity International Series Of Numerical Mathematics:

Ginzburg-Landau Phase Transition Theory and Superconductivity K.-H. Hoffmann,Q. Tang,2012-12-06 The theory of complex Ginzburg Landau type phase transition and its applications to superconductivity and superfluidity has been a topic of great interest to theoretical physicists and has been continuously and persistently studied since the 1950s Today there is an abundance of mathematical results spread over numerous scientific journals However before 1992 most of the studies concentrated on formal asymptotics or linear analysis Only isolated results by Berger Jaffe and Taubes and some of their colleagues touched the nonlinear aspects in great detail In 1991 a physics seminar given by Ed Copeland at Sussex University inspired Q Tang the co author of this monograph to study the subject Independently in Munich K H Hoffmann and his collaborators Z Chen and J Liang started to work on the topic at the same time Soon it became clear that at that time groups of mathematicians at Oxford and Virginia Tech had already studied the subject for a couple of years They inspired experts in interface phase transition problems and their combined effort established a rigorous mathematical framework for the Ginzburg Landau system At the beginning Q Tang collaborated with C M Elliott and H Matano

Ginzburg-Landau

Phase Transition Theory and Superconductivity Karl-Heinz Hoffmann,Qi Tang,2001 This monograph compiles rearranges and refines recent research results in the complex G L theory with or without immediate applications to the theory of superconductivity An authoritative reference for applied mathematicians theoretical physicists and engineers interested in the quantitative description of superconductivity using Ginzburg Landau theory

[Modeling, Simulation, and Optimization of Integrated Circuits](#) K. Antreich,R. Bulirsch,A. Gilg,P. Rentrop,2012-12-06 In November 2001 the

Mathematical Research Center at Oberwolfach Germany hosted the third Conference on Mathematical Models and Numerical Simulation in Electronic Industry It brought together researchers in mathematics electrical engineering and scientists working in industry The contributions to this volume try to bridge the gap between basic and applied mathematics research in electrical engineering and the needs of industry

Domain Decomposition Methods in Optimal Control of Partial Differential Equations John E. Lagnese,Günter Leugering,2012-12-06 This monograph considers problems of optimal control for partial differential equations of elliptic and more importantly of hyperbolic types on networked domains The main goal is to describe develop and analyze iterative space and time domain decompositions of such problems on the infinite dimensional level While domain decomposition methods have a long history dating back well over one hundred years it is only during the last decade that they have become a major tool in numerical analysis of partial differential equations A keyword in this context is parallelism This development is perhaps best illustrated by the fact that we just encountered the 15th annual conference precisely on this topic Without attempting to provide a complete list of introductory references let us just mention the monograph by Quarteroni and Valli 91 as a general up to date reference on domain decomposition methods for partial differential equations The emphasis of this monograph is to put domain decomposition methods in the context of

so called virtual optimal control problems and more importantly to treat optimal control problems for partial differential equations and their decompositions by an all at once approach. This means that we are mainly interested in decomposition techniques which can be interpreted as virtual optimal control problems and which together with the real control problem coming from an underlying application lead to a sequence of individual optimal control problems on the subdomains that are iteratively decoupled across the interfaces

Free Boundary Problems Pierluigi Colli, Claudio Verdi, Augusto

Visintin, 2012-12-06 Many phenomena of interest for applications are represented by differential equations which are defined in a domain whose boundary is a priori unknown and is accordingly named a free boundary. A further quantitative condition is then provided in order to exclude indeterminacy. Free boundary problems thus encompass a broad spectrum which is represented in this state of the art volume by a variety of contributions of researchers in mathematics and applied fields like physics, biology and material sciences. Special emphasis has been reserved for mathematical modelling and for the formulation of new problems

Trends and Applications in Constructive Approximation Marcel G. de Bruin, 2005-05-19

During the last years constructive approximation has reached out to encompass the computational and approximation theoretical aspects of different fields in applied mathematics including multivariate approximation methods qua interpolation and multivariate approximation by orthogonal polynomials as well as modern mathematical developments in neuro fuzzy approximation, R networks, industrial and engineering applications. Following the tradition of our international Bommerholz conferences in 1995, 1998 and 2001 we regard this 4th IBoMAT meeting as an important possibility for specialists in the field of applied mathematics to communicate about new ideas with colleagues from 15 different countries all over Europe and as far away as New Zealand and the USA. The conference in Witten-Bommerholz was as always held in a very friendly and congenial atmosphere. The IBoMAT series editor Detlef H. Mache, Bochum would like to congratulate Marcel de Bruin, Delft and József Szabados, Budapest for an excellent editing job of this 4th volume about Trends and Applications in constructive approximation. After the previous three published books in Akademie Verlag 1995 and Birkhäuser Verlag 1999 and 2003 we were pleased with the high quality of the contributions which could be solicited for the book. They are refereed and we should mention our gratitude to the referees and their reports

Nonlinear PDEs Guido Schneider, Hannes Uecker, 2017-10-26

This is an introductory textbook about nonlinear dynamics of PDEs with a focus on problems over unbounded domains and modulation equations. The presentation is example oriented and new mathematical tools are developed step by step giving insight into some important classes of nonlinear PDEs and nonlinear dynamics phenomena which may occur in PDEs. The book consists of four parts. Parts I and II are introductions to finite and infinite dimensional dynamics defined by ODEs and by PDEs over bounded domains respectively including the basics of bifurcation and attractor theory. Part III introduces PDEs on the real line including the Korteweg de Vries equation, the Nonlinear Schrödinger equation and the Ginzburg Landau equation. These examples often occur as simplest possible models namely as amplitude or modulation equations for some real world

phenomena such as nonlinear waves and pattern formation Part IV explores in more detail the connections between such complicated physical systems and the reduced models For many models a mathematically rigorous justification by approximation results is given The parts of the book are kept as self contained as possible The book is suitable for self study and there are various possibilities to build one or two semester courses from the book **Mathematica - revue d'analyse numérique et de théorie de l'approximation**, 2001
