

BLUE CARBON

COASTAL AND MARINE ECOSYSTEMS SUCH AS MANGROVE FORESTS, SEAGRASS BEDS AND TIDAL MARSHES CAPTURE AND STORE A HUGE AMOUNT OF CARBON. THIS IS CALLED BLUE CARBON

70% OF OCEAN CARBON

Coastal ecosystems occupy less than 0.5% of the global ocean surface area, yet store around 70% of total carbon sequestered by the world's oceans.

MORE THAN FORESTS

Mangroves, seagrass and tidal marshes store more carbon per unit area than terrestrial forests and play a crucial role in mitigating climate change.

SEAGRASSES

grow very fast, absorbing carbon from sea water to build their leaves and roots. Seagrass beds secure sediment and dead organic matter, storing a significant amount of carbon in the soil.

MANGROVES

absorb carbon dioxide from the atmosphere to photosynthesize. They are extremely effective at storing carbon in their leaves, wood and roots as well as in the sediments they hold in place.

TIDAL MARSHES

are home to numerous vegetation types that store carbon in addition to securing sediments and creating carbon-rich soil.

UNDER THREAT

Blue carbon ecosystems are being degraded globally at an alarming rate of 1-2% per year, often due to coastal development. Unsustainable harvesting, destructive fishing and pollution are also significant threats.

This reduces their capacity to store carbon, to support fisheries, and livelihoods or protect coastal communities – ultimately turning these key ecosystems from carbon sinks into sources of atmospheric carbon.

PROTECTION & RESTORATION

Protection and restoration of blue carbon ecosystems is crucial for humanity on a local and global scale. WCO is working with conservation partners and communities to achieve this, using science to contribute to the development of solutions including Marine Protected Areas and blue carbon credit systems. These efforts are supported by WCO's real conservation work, as healthy local reefs support productivity and biomass of blue carbon ecosystems.

Ecosystem Management Lebons From Around The World
