Ecology and Evolution of Cancer Beata Ujvari, Benjamin Roche, Frederic Thomas, 2017-02-08 Ecology and Evolution of Cancer is a timely work outlining ideas that not only represent a substantial and original contribution to the fields of evolution ecology and cancer but also goes beyond by connecting the interfaces of these disciplines This work engages the expertise of a multidisciplinary research team to collate and review the latest knowledge and developments in this exciting research field The evolutionary perspective of cancer has gained significant international recognition and interest which is fully understandable given that somatic cellular selection and evolution are elegant explanations for carcinogenesis Cancer is now generally accepted to be an evolutionary and ecological process with complex interactions between tumor cells and their environment sharing many similarities with organismal evolution As a critical contribution to this field of research the book is important and relevant for the applications of evolutionary biology to understand the origin of cancers to control neoplastic progression and to prevent therapeutic failures Covers all aspects of the evolution of cancer appealing to researchers seeking to understand its origins and effects of treatments on its progression as well as to lecturers in evolutionary medicine Functions as both an introduction to cancer and evolution and a review of the current research on this burgeoning exciting field presented by an international group of leading editors and contributors Improves understanding of the origin and the evolution of cancer aiding efforts to determine how this disease interferes with biotic interactions that govern ecosystems Highlights research that intends to apply evolutionary principles to help predict emergence and metastatic progression with the aim of improving therapies

The Cheating Cell Athena Aktipis, 2020-03-24 A fundamental and groundbreaking reassessment of how we view and manage cancer When we think of the forces driving cancer we don't necessarily think of evolution But evolution and cancer are closely linked because the historical processes that created life also created cancer The Cheating Cell delves into this extraordinary relationship and shows that by understanding cancer's evolutionary origins researchers can come up with more effective revolutionary treatments Athena Aktipis goes back billions of years to explore when unicellular forms became multicellular organisms Within these bodies of cooperating cells cheating ones arose overusing resources and replicating out of control giving rise to cancer Aktipis illustrates how evolution has paved the way for cancer's ubiquity and why it will exist as long as multicellular life does Even

so she argues this doesn't mean we should give up on treating cancer in fact evolutionary approaches offer new and promising options for the disease's prevention and treatments that aim at long term management rather than simple eradication Looking across species from sponges and cacti to dogs and elephants we are discovering new mechanisms of tumor suppression and the many ways that multicellular life forms have evolved to keep cancer under control By accepting that cancer is a part of our biological past present and future and that we cannot win a war against evolution treatments can become smarter more strategic and more humane Unifying the latest research from biology ecology medicine and social science *The Cheating Cell* challenges us to rethink cancer's fundamental nature and our relationship to it **Frontiers in Cancer Research** Carlo C. Maley, Mel Greaves, 2016-11-21 This is the ideal book for anyone contemplating starting a career in or shifting their career to studying the dynamics that drive cancer progression and its response to therapy Topics include the theory and population genetics of cancers genetic diversity within tumors intra tumor heterogeneity understanding how mutant clones expand in tissues the role of cancer stem cells in the dynamics of tumors the evolution of metastasis and how to improve cancer therapy by addressing the evolution of cancers in response to our interventions There are also chapters on the patterns of cancer susceptibility in humans due to a mismatch between our modern environment and the environment in which our ancestors evolved as well as a chapter on the evolution of cancer suppression mechanisms that have evolved in different species particularly the large long lived animals like elephants and whales that are better at suppressing cancers than humans This book serves as a primer on the evolutionary and ecological theory of cancer the framework upon which all the details of cancer may be hung It is ideal for oncologists and cancer researchers interested in evolutionary theory and evolutionary biologists and ecologists interested in gaining insights into cancer development and prevention **Evolution of Cancer** Professor Shinichi Okuyama, 1990-08-01 **Cancer through the Lens of Evolution and Ecology** Jason A. Somarelli, Norman A. Johnson, 2024-05-29 Cancer cells exist in an ever changing ecology and are subject to evolutionary pressures just like any species in nature This edited book explores the following themes 1 how the dynamics of mutation epigenetics and gene expression noise are sources of genetic diversity 2 how scarce resources influence cancer therapy resistance 3 how predator prey dynamics are mirrored in immune cancer cross talk 4 how cancer cells parallel niche construction theory 5 how changing fitness landscapes enable cancer growth and 6 how cancer cells interact within the body The book is a resource for understanding cancer as a disease of multicellularity grounded in evolutionary principles By using this knowledge researchers are starting to exploit these behaviors for treatment paradigms Key Features Bridges disciplines exemplifying the ways disparate fields create new perspectives when integrated Offers insights from leading scholars in cancer biology ecology and evolutionary biology Provides a timely recognition by oncologists that evolutionary paradigms are crucial for breakthroughs in cancer treatment Integrates basic and applied sciences of oncology and evolutionary biology Evolution of Cancer Shinichi Okuyama, Hitoshi Mishina, 1990 Cancer Melvyn F. Greaves, 2001 In this lucid and

entertaining book Mel Greaves argues that evolutionary biology offers a new perspective that can help us unravel the riddle of cancer Why for example have women always had such a raw deal in the cancer stakes And why are some cancers such as prostate cancer increasing in incidence Greaves argues that Darwinian selection millions of years ago has endowed our genes and cells with inherently cancerous credentials and this is exacerbated by our rapid social evolution and exotic behavioural traits that outpace genetic adaptation The book is full of novel insights the latest scientific discoveries and wonderful historical anecdotes It provides a unique portrait of cancer past present and future

Intratumor Diversity and Clonal Evolution in Cancer David Gisselsson, 2011-09-29 This specialized volume of *Advances in Cancer Research* is dedicated to the complex and largely unexplored field of intratumor diversity with respect to differences in both genotype and phenotype among cell populations within tumors Unique subject matter there are relatively few previous publications covering this complex topic even though it has been a matter of much speculation ever since cancers were first studied under the microscope more than a century ago This volume is an attempt to update the reader on novel findings as well as giving a historical perspective to the field It thereby offers an excellent starting point for young scientists entering this field of research Contributors many of the contributors are renowned cancer researchers with long term experience To bring in new ideas to the field these experienced authors have been blended with young bright minds who might provide novel starting points for solving old problems Technical aspects some chapters will be focused on specific techniques to address intratumor diversity and will therefore be helpful for colleagues wanting to broaden their technical expertise

Adaptive Oncogenesis James DeGregori, 2018-03-09 Popular understanding holds that genetic changes create cancer James DeGregori uses evolutionary principles to propose a new way of thinking about cancer's occurrence Cancer is as much a disease of evolution as it is of mutation one in which mutated cells outcompete healthy cells in the ecosystem of the body's tissues His theory ties cancer's progression or lack thereof to evolved strategies to maximize reproductive success Through natural selection humans evolved genetic programs to maintain bodily health for as long as necessary to increase the odds of passing on our genes but not much longer These mechanisms engender a tissue environment that favors normal stem cells over precancerous ones Healthy tissues thwart cancer cells ability to outcompete their precancerous rivals But as our tissues age or accumulate damage from exposures such as smoking normal stem cells find themselves less optimized to their ecosystem Cancer causing mutations can now help cells adapt to these altered tissue environments and thus outcompete normal cells Just as changes in a species habitat favor the evolution of new species changes in tissue environments favor the growth of cancerous cells DeGregori's perspective goes far in explaining who gets cancer when it appears and why While we cannot avoid mutations it may be possible to sustain our tissues natural and effective system of defense even in the face of aging or harmful exposures For those interested in learning how cancers arise within the human body the insights in *Adaptive Oncogenesis* offer a compelling perspective

Pathogens Associated with the Development of Cancer in Humans

Noé Velázquez-Márquez, Genaro Alberto Paredes-Juárez, Verónica Vallejo-Ruiz, 2024-08-08 This book examines the relationship between the different infectious agents such as viruses bacteria protozoa and fungi in the development of cancer It is divided into six sections spanning a range of topics including infectious agents main bacterial agents and eukaryotic microorganisms and how they contribute to cancer Chapters also explore the anti tumor effect of microorganisms how pathogens induce epigenetic changes that are associated with cancer and nutritional management for the prevention and treatment of pathogen associated cancer from a nutrigenomics perspective The studies included cover epidemiological and immunological data different OMICs data in general and data of pathogens associated with cancer The book is rounded out with an analysis of the role of glycans and molecular evolution in the progression of cancer **Chance, Necessity, Love**

Leonard M. Hummel, Gayle E. Woloschak, 2017-07-18 What exactly is cancer And where is God and what is love amidst the complex evolutionary development of all cancers In *Chance Necessity Love An Evolutionary Theology of Cancer* Hummel and Woloschak address these questions that arise for many people with cancer and in all who grapple with making meaning of science about cancers In order to do so the authors first clarify new scientific findings about cancer and then offer faithful and wise theological perspectives on these discoveries In doing so they make plain what cannot and can be changed about cancer And in doing so they show how cancer is an evolutionary disease that develops according to the same dynamics of chance that is random occurrences and necessity law like regularities at work in all other evolutionary phenomena Therefore they ask where is God and what is love within the evolutionary chance and necessity operative throughout all aspects of cancer They offer the readers thoughtful responses to this question and many others life death hope acceptance and love given the evolutionary nature of cancer **Human Evolution** Graeme Finlay, 2013-09-12 Brings together new research demonstrating how evidence based on genetic phenomena should end any lingering controversy over human evolution

Dynamics of Cancer Steven A. Frank, 2007-07-22 The onset of cancer presents one of the most fundamental problems in modern biology In *Dynamics of Cancer* Steven Frank produces the first comprehensive analysis of how particular genetic and environmental causes influence the age of onset The book provides a unique conceptual and historical framework for understanding the causes of cancer and other diseases that increase with age Using a novel quantitative framework of reliability and multistage breakdown Frank unifies molecular demographic and evolutionary levels of analysis He interprets a wide variety of observations on the age of cancer onset the genetic and environmental causes of disease and the organization of tissues with regard to stem cell biology and somatic mutation Frank uses new quantitative methods to tackle some of the classic problems in cancer biology and aging how the rate of increase in the incidence of lung cancer declines after individuals quit smoking the distinction between the dosage of a chemical carcinogen and the time of exposure and the role of inherited genetic variation in familial patterns of cancer This is the only book that presents a full analysis of the age of cancer onset It is a superb teaching tool and a rich source of ideas for new and experienced researchers For cancer biologists

population geneticists evolutionary biologists and demographers interested in aging this book provides new insight into disease progression the inheritance of predisposition to disease and the evolutionary processes that have shaped organismal design *Cancer Evolution: From Biological Insights to Therapeutic Opportunities* Marco Mina, Lorenzo Gerratana, Andrew Davis, 2022-09-20

Rebel Cell Kat Arney, 2020-10-20 Why do we get cancer Is it our modern diets and unhealthy habits Chemicals in the environment An unwelcome genetic inheritance Or is it just bad luck The answer is all of these and none of them We get cancer because we can't avoid it it's a bug in the system of life itself Cancer exists in nearly every animal and has afflicted humans as long as our species has walked the earth In *Rebel Cell* Cancer Evolution and the New Science of Life's Oldest Betrayal Kat Arney reveals the secrets of our most formidable medical enemy most notably the fact that it isn't so much a foreign invader as a double agent cancer is hardwired into the fundamental processes of life New evidence shows that this disease is the result of the same evolutionary changes that allowed us to thrive Evolution helped us outsmart our environment and it helps cancer outsmart its environment as well alas that environment is us Explaining why everything we know about cancer is wrong Arney a geneticist and award winning science writer guides readers with her trademark wit and clarity through the latest research into the cellular mavericks that rebel against the rigid biological society of the body and make a leap towards anarchy We need to be a lot smarter to defeat such a wily foe smarter even than Darwin himself In this new world where we know that every cancer is unique and can evolve its way out of trouble the old models of treatment have reached their limits But we are starting to decipher cancer's secret evolutionary playbook mapping the landscapes in which these rogue cells survive thrive or die and using this knowledge to predict and confound cancer's next move *Rebel Cell* is a story about life and death hope and hubris nature and nurture It's about a new way of thinking about what this disease really is and the role it plays in human life Above all it's a story about where cancer came from where it's going and how we can stop it

Why does Evolution Matter? The Importance of Understanding Evolution Gabriel Trueba, 2014-10-17 Evolution is not merely a chapter in biology textbooks rather it is the mesh that embraces and connects every biological phenomenon indeed as Dobzhansky pointed out nothing in biology could be understood without the evolutionary logic The contents of this book highlight the importance of evolution in applied biological sciences such as agricultural medical environmental and the social sciences Evolutionary science provides renewed ideas which can result in practical applications and tools that deal with current problems concerning humanity such as disease food production and environmental destruction Most of the topics in this book were discussed during the III Summit on Evolution which took place in the Galapagos Islands in June 2013 hosted by the Galapagos Institute for the Arts and Sciences and the Galapagos Science Institute Universidad San Francisco de Quito

Peto's Paradox and the Evolution of Cancer Suppression Brian Michael Muir, 2016 An unsuspected finding in cancer research is that different cancers result from mutations in different genes. If cancer is a problem of multicellularity, why is there not a single set of genes regulating all cancers of multicellular animals? Cancer risk is expected to be higher in larger, longer-lived species since the risk of cancer-initiating somatic mutations is expected to increase with the number of lifetime cell divisions. However, this expected relationship is not observed and has been termed Peto's Paradox. The evolution of additional mechanisms of cancer suppression in large, long-lived species can resolve the paradox and may explain the differences in the genetics of cancer between species and tissues. In a proof-of-concept experimental evolution study, fruit flies with hereditary tumors were selected to evolve suppression of these tumors. A significant reduction in the incidence of tumors was observed in the final populations. The genetic changes involved in the evolution of additional mechanisms may come in two forms. First, a cancer suppression mechanism acting may be recruited by its upregulation of gene expression in the target tissue. To address this, I compared the levels of gene expression of 15 tumor suppressor genes and 8 proto-oncogenes across dozens of non-diseased human tissues. I found that 15 of the 23 genes have their highest level of expression in the tissue types where they are implicated in hereditary cancer relative to the tissue types where they are not. Second, additional mechanisms may arise by duplications of pre-existing tumor suppressor genes already acting in the target tissue. The recent finding of additional copies of the critical tumor suppressor gene TP53 in the large-bodied African Elephant and the long-lived microbats has been suggested to explain the low rates of cancers in these species. However, in a phylogenetic comparison of the coding regions of these retrogene copies relative to the normal TP53 copies in 24 mammals, I find that the additional copies in the elephant and bats are truncated early by stop codons and are poorly conserved. In conclusion, incorporating evolutionary theory into cancer biology is critical for understanding the variation in cancer genetics across tissues and species.

Cancer Evolution Charles Swanton, 2017 Tumor progression is driven by mutations that confer growth advantages to different subpopulations of cancer cells. As a tumor grows, these subpopulations expand, accumulate new mutations, and are subjected to selective pressures from the environment, including anticancer interventions. This process, termed clonal evolution, can lead to the emergence of therapy-resistant tumors and poses a major challenge for cancer eradication efforts. Written and edited by experts in the field, this collection from Cold Spring Harbor Perspectives in Medicine examines cancer progression as an evolutionary process and explores how this way of looking at cancer may lead to more effective strategies for managing and treating it. The contributors review efforts to characterize the subclonal architecture and dynamics of tumors, understand the roles of

chromosomal instability driver mutations and mutation order and determine how cancer cells respond to selective pressures imposed by anticancer agents immune cells and other components of the tumor microenvironment They compare cancer evolution to organismal evolution and describe how ecological theories and mathematical models are being used to understand the complex dynamics between a tumor and its microenvironment during cancer progression The authors also discuss improved methods to monitor tumor evolution e g liquid biopsies and the development of more effective strategies for managing and treating cancers e g immunotherapies This volume will therefore serve as a vital reference for all cancer biologists as well as anyone seeking to improve clinical outcomes for patients with cancer
