Theory and Practice of Model Transformations Antonio Vallecillo, Jeff Gray, Alfonso Pierantonio, 2008-07-01 Models have become essential for dealing with the numerous aspects involved in developing and maintaining complex IT systems Models allow capturing of the relevant aspects of a system from a given perspective and at a precise level of abstraction In addition to models the transformations between them are other key elements in model driven engineering Model transformations allow the definition and implementation of the operations on models and also provide a chain that enable the automated development of a system from its corresponding models Furthermore model transformations may be realized using models and are therefore an integral part of any model driven approach There are already several proposals for model transformation specification implementation and execution which are beginning to be used by modeling practitioners However model transformations need specialized support in several aspects in order to realize their full potential The problem goes beyond having specific languages to represent model transformations we also need to understand their foundations such as the key concepts and operators supporting those languages their semantics and their structuring mechanisms and properties e.g modularity composability and parametrization In addition model transformations can be stored in repositories as reusable assets where they can be managed discovered and reused There is also a need to chain and combine model transformations in order to produce new and more powerful transformations and to be able to implement new operations on models Finally model transformations need methodology support i.e they need to be integrated into software development methodologies supported by appropriate tools and environments These issues and concerns define the focus of these proceedings
