This new concise text takes a more contemporary approach to materials science than the more traditional books in this subject with a special emphasis on using an inductive method to first introduce materials and their particular properties and then to explain the underlying physical and chemical phenomena responsible for those properties. The text pays particular attention to the newer classes of materials such as ceramics, polymers and composites and treats them as part of two essential classes: structural materials and functional materials rather than the traditional method of emphasizing structural materials alone. This book is recommended for second and third year engineering students taking a required one or two semester sequence in introductory materials science and engineering as well as graduate level students in materials, electrical, chemical and manufacturing engineering who need to take this as a core prerequisite. Presents balanced coverage of both structural and functional materials. Types of materials are introduced first followed by explanation of physical and chemical phenomena that drive their specific properties. Strong focus on engineering applications of materials. The first materials science text to include a whole chapter devoted to batteries. Provides clear, mathematically simple explanations of basic chemistry and physics underlying materials properties.

Solid State Ionics: Materials & Devices, Procs Of The 7th Asian Conf B V R Chowdari, Wenji Wang, 2000-10-27 Solid state ionics being a multidisciplinary area is expected to grow at a faster rate in the new millennium prompting the discovery of new materials and devices as well as helping to optimize the known devices especially the portable power sources and display systems. The Asian Society for Solid State Ionics (ASSSI) plays a significant role in bringing together researchers from the Asian countries every two years to exchange notes and ideas to foster friendship and collaboration and to discuss the prospects. The topics covered in this volume are ion dynamics, theoretical modeling, ion conducting polymers, gels and ceramics, glasses, crystalline materials including nano-phases, composites, electrode/electrolyte interfaces and novel experimental techniques. Papers on crystalline materials deal with ion conduction in Li, Na, Ag, Tl, F and O containing compounds. Materials and device aspects have received wide coverage especially the areas of lithium ion batteries (LIBs) and solid oxide fuel cells (SOFCs). Rechargeable high energy density LIBs especially those employing immobilized gel or polymer electrolyte are the favorite portable power sources in the new millennium. As expected a large number of papers on both cathodes and polymer electrolytes for LIBs were presented at the conference. The papers on fuel cells almost exclusively deal with SOFCs indicating the great importance being given to this area in Japan and China. A breakthrough in materials and technology of SOFC is expected in the coming decade. This volume will be useful not only to the active researchers in the field but also to youngsters entering the exciting area of solid state ionics.
