N. Jiang, 2007 Electroanalytical chemistry as the name implies involves the analysis of chemical species through the use of electrochemical methods Generally alterations are measured in the concentration of a chemical species by measuring changes in current in response to an applied voltage with respect to time According to Faraday's law the charge is directly proportional to the amount of species undergoing a loss oxidation or gain reduction of electrons Constant potential amperometry high speed chronoamperometry fast cyclic voltammetry FCV and differential pulse voltammetry DPV are the most common voltammetric techniques used to detect monoamine neurotransmitters ie serotonin dopamine norepinephrine Each method has its pros and cons In constant potential amperometry a uniform potential is applied and the change in current is monitored as a function of time The advantage of this technique is that the time resolution is limited only by the data collection frequency of the instrument      **Laboratory**
