Conway, John O'M. Bockris, Ralph E. White, 2012-12-06 It gives us pleasure in writing the Preface to this volume in which we tried to bring together a number of stimulating and interesting people discussing physical electrochemistry The first chapter by Ashok Vijn

gives a remarkable account of electrochemistry as looked at from a physicist's point of view. Among the revelations of the chapter is that in a recent survey of leading areas in Science two out of fifteen areas chosen were electrochemical and these two were the only chemical subjects chosen. In Mikhail Vorotyntsev's chapter one finds a very modern study of the double layer but tenuously connected with the simpler studies made in the safe harbor of mercury. In the pioneering chapter by Pons et al. one is looking at a cutting edge of electrochemistry at this time: the use of IR spectroscopy in modes which allow the first practical determinations of the spectra of adsorbed species at the interface, an area pioneered by Pons himself. In Chapter 4 we have reached photoelectrochemistry once more but now Tributsch speaks about what has rapidly become the major area of that topic: photoelectrocatalysis. Close to this chapter and indeed intellectually connected with it is that by Schmickler and Schultze about electron transfer reactions at oxide-covered metal electrodes in which theories which are still relatively dubious for metal solution surfaces are applied to complex systems involving oxides.

Interfacial Electrochemistry Wolfgang Schmickler, 1996-02-29. Electrochemistry is the study of a special class of interfaces: those between an ionic and an electronic conductor that can conduct current. This makes it especially important to research and for industrial applications such as semiconductors. This book examines different topics within interfacial electrochemistry including the theory of structures and processes at metal solution and semiconductor solution interfaces, the principles of classical and modern experimental methods and some of the applications of electrochemistry. Students and nonspecialists in materials science, surface science and chemistry will find this a valuable source of information.

Charge Transfer Reactions in Electrochemical and Chemical Processes L.I. Krishtalik, 2012-12-06. The mechanism of an elementary act is undoubtedly one of the most fundamental problems of chemical and in particular electrochemical kinetics. Although this problem has fascinated scientists for quite a long time, it was only in the late fifties and early sixties that it began to be actively investigated for charge transfer reactions. Owing to the development of new methods in the analysis of this problem, significant advancements were made in theoretical as well as experimental studies. These investigations showed that the physical mechanism of charge transfer in all processes including heterogeneous electrochemical and homogeneous chemical and biochemical processes is basically the same. Hence the results obtained in the field of electrochemical kinetics are relevant to the understanding of homogeneous chemical reactions as well. This book endeavors to summarize the results of investigations carried out during the last two decades. It is based on the author's monograph *Electrode Reactions: The Mechanism of an Elementary Act* Nauka 1979. As compared to the first version, the book has been considerably revised and enlarged not only to include a large body of data published between 1978 and 1982 but also to analyze in detail the links between electrochemical and homogeneous, in particular enzymatic kinetics. As a result, a new chapter has been added to the book. The change in the title reflects the fact that the material contained in the book is not restricted to an investigation of purely electrochemical problems.
