Electromagnetic Scintillation Vol 1 Geometrical Optics:

Electromagnetic Scintillation: Volume 1, Geometrical Optics Albert D. Wheelon, 2001-09-06 Electromagnetic Scintillation describes the phase and amplitude fluctuations imposed on signals that travel through the atmosphere. The volumes that make up Electromagnetic Scintillation will provide a modern reference and comprehensive tutorial treating both optical and microwave propagation and integrating measurements and predictions at each step of the development. This first volume deals with phase and angle of arrival measurement errors accurately described by geometrical optics. It will be followed by a further volume examining weak scattering. In this book measured properties of tropospheric and ionospheric irregularities are reviewed first. Electromagnetic fluctuations induced by these irregularities are then estimated for a wide range of applications. The book will be of interest to those working in the resolution of astronomical interferometers and large single aperture telescopes as well as synthetic aperture radars and laser pointing tracking systems. It is also directly relevant to those working in laser metrology, GPS location accuracy and terrestrial and satellite communications. Electromagnetic Scintillation: Volume 2, Weak Scattering Albert D. Wheelon, 2003-07-31 Electromagnetic Scintillation describes the phase and amplitude fluctuations imposed on signals that travel through the atmosphere. These volumes provide a modern reference and comprehensive tutorial for this subject treating both optical and microwave propagation. Measurements and predictions are integrated at each step of the development. The first volume dealt with phase and angle of arrival measurement errors which are accurately described by geometrical optics. This second volume concentrates on amplitude and intensity fluctuations of the received signal. *Electromagnetic Scintillation* Albert Dewell Wheelon, 2001 An important reference work for researchers in optics, astronomy, physics and electrical engineering. **Electromagnetic Scintillation** Albert Dewell Wheelon, 2001 *Non-Gaussian Statistical Communication Theory* David Middleton, 2012-05-11 The book is based on the observation that communication is the central operation of discovery in all the sciences. In its active mode we use it to interrogate the physical world sending appropriate signals and receiving nature's reply. In the passive mode we receive nature's signals directly. Since we never know a priori what particular return signal will be forthcoming we must necessarily adopt a probabilistic model of communication. This has developed over the approximately seventy years since its beginning into a Statistical Communication Theory or SCT. Here it is the set or ensemble of possible results which is meaningful. From this ensemble we attempt to construct in the appropriate model format based on our understanding of the observed physical data and on the associated statistical mechanism analytically represented by suitable probability measures. Since its inception in the late 30s of the last century and in particular subsequent to World War II, SCT has grown into a major field of study. As we have noted above, SCT is applicable to all branches of science. The latter itself is inherently and ultimately probabilistic at all levels. Moreover, in the natural world there is always a random background noise as well as an inherent a priori uncertainty in the presentation of deterministic observations, i.e. those which are specifically obtained a

posteriori The purpose of the book is to introduce Non Gaussian statistical communication theory and demonstrate how the theory improves probabilistic model The book was originally planned to include 24 chapters as seen in the table of preface Dr Middleton completed first 10 chapters prior to his passing in 2008 Bibliography which represents remaining chapters are put together by the author's close colleagues Drs Vincent Poor Leon Cohen and John Anderson email pressbooks.ieee.org to request Ch 10

David F. Buscher,2015-07-28 Optical interferometry is a powerful technique to make images on angular scales hundreds of times smaller than is possible with the largest telescopes This concise guide provides an introduction to the technique for graduate students and researchers who want to make interferometric observations and acts as a reference for technologists building new instruments Starting from the principles of interference the author covers the core concepts of interferometry showing how the effects of the Earth s atmosphere can be overcome using closure phase and the complete process of making an observation from planning to image reconstruction This rigorous approach emphasizes the use of rules of thumb for important parameters such as the signal to noise ratios requirements for sampling the Fourier plane and predicting image quality The handbook is supported by web resources including the Python source code used to make many of the graphs as well as an interferometry simulation framework available at www.cambridge.org/9781107042179 GPS Stochastic Modelling Xiaoguang Luo,2013-07-06 Global Navigation Satellite Systems GNSS such as GPS have become an efficient reliable and standard tool for a wide range of applications However when processing GNSS data the stochastic model characterising the precision of observations and the correlations between them is usually simplified and incomplete leading to overly optimistic accuracy estimates This work extends the stochastic model using signal to noise ratio SNR measurements and time series analysis of observation residuals The proposed SNR based observation weighting model significantly improves the results of GPS data analysis while the temporal correlation of GPS observation noise can be efficiently described by means of autoregressive moving average ARMA processes Furthermore this work includes an up to date overview of the GNSS error effects and a comprehensive description of various mathematical methods

Transionospheric Synthetic Aperture Imaging Mikhail Gilman,Erick Smith,Semyon Tsynkov,2017-04-13 This landmark monograph presents the most recent mathematical developments in the analysis of ionospheric distortions of SAR images and offers innovative new strategies for their mitigation As a prerequisite to addressing these topics the book also discusses the radar ambiguity theory as it applies to synthetic aperture imaging and the propagation of radio waves through the ionospheric plasma including the anisotropic and turbulent cases In addition it covers a host of related subjects such as the mathematical modeling of extended radar targets as opposed to point wise targets and the scattering of radio waves off

those targets as well as the theoretical analysis of the start stop approximation which is used routinely in SAR signal processing but often without proper justification The mathematics in this volume is clean and rigorous no assumptions are hidden or ambiguously stated The resulting work is truly interdisciplinary providing both a comprehensive and thorough exposition of the field as well as an accurate account of a range of relevant physical processes and phenomena The book is intended for applied mathematicians interested in the area of radar imaging or more generally remote sensing as well as physicists and electrical electronic engineers who develop operate spaceborne SAR sensors and perform the data processing The methods in the book are also useful for researchers and practitioners working on other types of imaging Moreover the book is accessible to graduate students in applied mathematics physics engineering and related disciplines Praise for Transionospheric Synthetic Aperture Imaging I perceive that this text will mark a turning point in the field of synthetic aperture radar research and practice I believe this text will instigate a new era of more rigorous image formation relieving the research development and practitioner communities of inconsistent physical assumptions and numerical approaches Richard Albanese Senior Scientist Albanese Defense and Energy Development LLC **The Ionosphere with GNSS SDR**

Integrated Modeling of Telescopes Torben Andersen,Anita Enmark,2011-06-23 Ground or space based telescopes are becoming increasingly more complex and construction budgets are typically in the billion dollar range Facing costs of this magnitude availability of engineering tools

for prediction of performance and design optimization is imperative Establishment of simulation models combining different technical disciplines such as Structural Dynamics Control Engineering Optics and Thermal Engineering is indispensable Such models are normally called Integrated Models because they involve many different disciplines The models will play an increasingly larger role for design of future interdisciplinary optical systems in space or on ground The book concentrates on integrated modeling of optical and radio telescopes but the techniques presented will be applicable to a large variety of systems Hence the book will be of interest to optical and radio telescope designers designers of spacecrafts that include optical systems and to designers of various complex defense systems The book may also find use as a textbook for undergraduate and graduate courses within the field Adaptive Optics is an exciting and relatively new field originally dedicated to correction for blurring when imaging through the atmosphere Although this objective is still of high importance the concept of Adaptive Optics has recently evolved further Today the objective is not only to correct for atmospheric turbulence effects but also for a range of static and dynamical telescope aberrations The notion of adaptive optics has expanded to the field of Wavefront Control correcting for a variety of system aberrations Wavefront control systems maintain form and position of optical elements with high precision under static and dynamical load In many ways such systems replace the steel structures of traditional optical systems thereby providing much lighter systems with a performance not possible before Integrated Modeling is the foremost tool for studies of Wavefront Control for telescopes and complex optics and is therefore now of high importance Springer has recently published two books on telescopes Reflecting Telescope Optics by R Wilson and The Design and Construction of Large Optical Telescopes by P Bely Noting that a new and expensive generation of Extremely Large Telescopes with apertures in the 30 100 m range is on the way the present book on integrated modeling is a good match to the existing books and an appropriate specialization and continuation of some subjects dealt with in those books
