This book endeavors to break the stereotype that basic electrical machine courses are limited only to transformers DC brush machines induction machines and wound field synchronous machines It is intended to serve as a textbook for basic courses on Electrical Machines covering the fundamentals of the electromechanical energy conversion transformers classical electrical machines i.e DC brush machines induction machines wound field rotor synchronous machines and modern electrical machines i.e switched reluctance machines SRM and permanent magnet PM brushless machines In addition to academic research and teaching the author has worked for over 18 years in US high technology corporate businesses providing solutions to problems such as design simulation manufacturing and laboratory testing of large variety of electrical machines for electric traction energy generation marine propulsion and aerospace electric systems **Electro-mechanical Energy Conversion with Dynamics of Machines** Rakosh Das Begamudre, 1988

A detailed introduction to electro mechanical energy conversion and electric

machines that treats the basic principles of electric and magnetic machines This book covers the broad spectrum of the operating characteristics of machines testing and aspects of design It considers the machine as an element of an interconnected power system subjected to transients and as a unit affecting the stability of the system The applications of basic Faraday Lenz and Ampere force laws are described together with devices based upon those laws The book also examines harmonic torques caused by non sinusoidal excitation using modern solid state devices Solid state VAR systems are detailed as well as synchronous machines and dynamics of machines About 300 illustrations and an extensive bibliography are featured and worked examples throughout the book reinforce the theory covered
