Comets and the Origin and Evolution of Life Paul J. Thomas,Christopher F. Chyba,Christopher P. McKay,2013-03-09 This volume considers the role comets may have played in the origins and evolution of life particularly in light of recent investigations of Halley's comet of new insights into organic synthesis in meteorites and comets and of new results of numerical simulations of cometary orbits and impacts on Earth. The book is intended as a comprehensive review of current research accessible to graduate students and others new to the field. Each chapter was prepared by an expert to give an overview of an aspect of the field and carefully revised by the editors for uniformity in style and presentation.

**Chemistry**

**and Physics of Terrestrial Planets** Surendra K. Saxena,2012-12-06 The purpose of this volume is to present the latest planetary studies of an international body of scientists concerned with the physical and chemical aspects of terrestrial planets. In recent years planetary science has developed in leaps and bounds. This is a result of the application of a broad range of scientific disciplines particularly physical and chemical to an understanding of the information received from manned and unmanned space exploration. The first five chapters expound on many of the past and recent observations in an attempt to develop meaningful physical chemical models of planetary formation and evolution. For any discussion of the chemical processes in the solar nebula it is important to understand the boundary conditions of the physical variables. In Chapter 1 Saf ranov and Vitjazev have laid down explicitly all the physical constraints and the problems of time dependence of nebular evolutionary processes. Planetary scientists and students will find in this chapter a collection of astrophysical parameters on the transfer of angular momentum formation of the disk and the gas envelope nebular turbulence physical mixing of particles of various origins and growth of planetesimals. The authors conclude their work with important information on evolution of terrestrial planets. Although symbols are defined in the text of the article readers who are not familiar with the many symbols and abbreviations in astrophysical literature will find it useful to consult the Appendix for explanations.

Mantle Convection in the Earth and Planets Gerald Schubert,Donald Lawson Turcotte,Peter Olson,2001 Comprehensive and up to date synthesis of all aspects of mantle convection for advanced students and researchers.

*A History of Modern Planetary Physics* Stephen G. Brush,1996-04-26 Where did we come from Before there was life there had to be something to live on a planet a solar system During the past 200 years astronomers and geologists have developed and tested several different theories about the origin of the solar system and the nature of the Earth. Together the three volumes that make up A History of Modern Planetary Physics present a survey of these theories. The early twentieth century saw the replacement of the Nebular Hypothesis with the Chamberlain Moulton theory that the solar system resulted from the encounter of the Sun with a passing star. Fruitful Encounters follows the eventual refutation of the encounter theory and the

subsequent revival of a modernised Nebular Hypothesis Professor Brush also discusses the role of findings from the Apollo space programme especially the analysis of lunar samples culminating in the establishment in the 1980s of the giant impact theory of the Moon's origin     **Progress in Metamorphic and Magmatic Petrology** L. L. Perchuk, 1991 A collection of review articles by eminent petrologists summarizing recent scientific achievements in this field The papers address the physico chemical conditions of the origin of crystalline rocks as well as characteristics of their mineral assemblages The book is divided into three main sections Section 1 covers general thermodynamics and mineral equilibria Section 2 covers metamorphic and metasomatic processes and the final section discusses the mantle and magmatic processes

*Atmospheric Evolution on Inhabited and Lifeless Worlds* David C. Catling, James F. Kasting, 2017-04-13 A comprehensive and authoritative text on the formation and evolution of planetary atmospheres for graduate level students and researchers

**Treatise on Geophysics, Volume 9** David Stevenson, 2010-05-18 Evolution of the Earth focuses on the formation of Earth Topics include the differentiation of the core mantle and crust the formation of the ocean basins and continents outgassing and volcanism the initiation of plate tectonics the origin and persistence of Earth's magnetic field the growth of the inner core changes in mantle convection through time and the impact of life on the planet The volume takes an interdisciplinary viewpoint that emphasizes the interplay of geophysics other aspects of earth science and biological evolution Some outstanding questions are identified and debated Self contained volume starts with an overview of the subject then explores each topic with in depth detail Extensive reference lists and cross references with other volumes to facilitate further research Full color figures and tables support the text and aid in understanding Content suited for both the expert and non expert     The Soviet-American Conference on Cosmochemistry of the Moon and Planets John H.

Pomeroy, 1977     *Meteorites and the Early Solar System II* Dante S. Lauretta, Harry Y. McSween, 2006-07 They range in size from microscopic particles to masses of many tons The geologic diversity of asteroids and other rocky bodies of the solar system are displayed in the enormous variety of textures and mineralogies observed in meteorites The composition chemistry and mineralogy of primitive meteorites collectively provide evidence for a wide variety of chemical and physical processes This book synthesizes our current understanding of the early solar system summarizing information about processes that occurred before its formation It will be valuable as a textbook for graduate education in planetary science and as a reference for meteoriticists and researchers in allied fields worldwide     **Comparative Climatology of Terrestrial Planets** Stephen J. Mackwell, Amy A. Simon-Miller, Jerald W. Harder, Mark A. Bullock, 2014-01-30 Through the contributions of more than sixty leading experts in the field Comparative Climatology of Terrestrial Planets sets forth the foundations for this emerging new science and brings the reader to the forefront of our current understanding of atmospheric formation and climate evolution

Provided by publisher     *Meteorites, Comets, and Planets* A.M. Davis, 2005-11-21 Volume 1 provides a broad overview of the chemistry of the solar system It includes chapters on the origin of the elements and solar system abundances the solar nebula

and planet formation meteorite classification the major types of meteorites important processes in early solar system history geochemistry of the terrestrial planets the giant planets and their satellite comets and the formation and early differentiation of the Earth This volume is intended to be the first reference work one would consult to learn about the chemistry of the solar system Reprinted individual volume from the acclaimed Treatise on Geochemistry 10 Volume Set ISBN 0 08 043751 6 published in 2003   **Origin of the Earth and Moon** Robin M. Canup,Kevin Righter,2000-11-01 The age old question of how our home planet and its satellite originated has in recent times undergone a minor revolution The emergence of the giant impact theory as the most successful model for the origin of the Moon has been difficult to reconcile with some aspects of the Earth and the development of an integrated model for the origin of the Earth Moon system has been difficult for this reason However recent technical advances in experimental and isotopic work together with intensified interest in the modeling of planetary dynamics have produced a wealth of new results requiring a rethinking of models for the origin of the Earth and Moon This book is intended to serve as a resource for those scientists working closely in this field while at the same time it provides enough balance and depth to offer an introduction for students or technically minded general readers Its thirty chapters address isotopic and chemical constraints on accretion the dynamics of terrestrial planet formation the impact triggered formation of the Earth Moon system differentiation of the Earth and Moon the origin of terrestrial volatiles and conditions on the young Earth and Moon Covering such subjects as the history and origin of the Moon s orbit water on the Earth and the implications of Earth Moon interactions for terrestrial climate and life the book constitutes a state of the art overview of the most recent investigations in the field Although many advances have been made in our ability to evaluate competing models of the formation of the Earth Moon system there are still many gaps in our understanding This book makes great strides toward closing those gaps by highlighting the extensive progress that has been made and pointing toward future research

**Mechanics of Turbulence of Multicomponent Gases** Mikhail Ya. Marov,Aleksander V. Kolesnichenko,2006-04-18 Space exploration and advanced astronomy have dramatically expanded our knowledge of outer space and made it possible to study the indepth mechanisms underlying various natural phenomena caused by complex interaction of physical chemical and dynamical processes in the universe Huge breakthroughs in astrophysics and the planetary sciences have led to increasingly complicated models of such media as giant molecular clouds giving birth to stars protoplanetary accretion disks associated with the solar system s formation planetary atmospheres and circumplanetary space The creation of these models was promoted by the development of basic approaches in modern chanics and physics paralleled by the great advancement in the computer sciences As a result numerous multidimensional non stationary problems involving the analysis of evolutionary processes can be investigated using wide range numerical experiments Turbulence belongs to the most widespread and at the same time the most complicated natural phenomena related to the origin and development of organized structures dies of different scale at a definite flow regime of fluids in essentially non

linear hydrodynamic systems This is also one of the most complex and intriguing sections of the mechanics of fluids The direct numerical modeling of turbulent flows encounters large mathematical difficulties while the development of a general turbulence theory is hardly possible because of the complexity of interacting coherent structures Three dimensional non steady motions arise in such a system under loss of linear flow stability defined by the critical value of the Reynolds number

*Origin of the Earth and Moon* Alfred E. Ringwood, 2012-12-06 Since the beginning of civilization the origins of the Earth and Moon have been the subjects of continuing interest speculation and enquiry These are also among the most challenging of all scientific problems They are perhaps to a unique degree interdisciplinary having attracted the attention of philosophers astronomers mathematicians geologists chemists and physicists A large and diverse literature has developed far beyond the capacity of individuals to assimilate adequately Consequently most of those who attempt to present review syntheses in the area tend to reflect the perspectives of their own particular disciplines The present author's approach is that of a geochemist strongly influenced by the basic philosophy of Harold Urey Whereas most astronomical phenomena are controlled by gravitational and magnetic fields and by nuclear interactions Urey 1952 emphasized that the formation of the solar system occurred in a pressure temperature regime wherein the chemical properties of matter were at least as important as those of gravitational and magnetic fields This was the principal theme of his 1952 book *The Planets* which revolutionized our approach to this subject In many subsequent papers Urey strongly emphasized the importance of meteorites in providing critical evidence of chemical conditions in the primordial solar nebula and of the chemical fractionation processes which occurred during formation of the terrestrial planets This approach has been followed by most subsequent geochemists and cosmochemists

**The Early Earth** James Badro, Michael J. Walter, 2015-08-25 The Early Earth Accretion and Differentiation provides a multidisciplinary overview of the state of the art in understanding the formation and primordial evolution of the Earth The fundamental structure of the Earth as we know it today was inherited from the initial conditions 4.56 billion years ago as a consequence of planetesimal accretion large impacts among planetary objects and planetary scale differentiation The evolution of the Earth from a molten ball of metal and magma to the tectonically active dynamic habitable planet that we know today is unique among the terrestrial planets and understanding the earliest processes that led to Earth's current state is the essence of this volume Important results have emerged from a wide range of disciplines including cosmochemistry geochemistry experimental petrology experimental and theoretical mineral physics and geodynamics The topics in this volume include Condensation of primitive objects in the solar nebula planetary building blocks Early and late accretion and planetary dynamic modeling Primordial differentiation core formation Magma Ocean evolution and crystallization This volume will be a valuable resource for graduate students academics and researchers in the fields of geophysics geochemistry cosmochemistry and planetary science
