Evolution Above The Species Level:

Evolution Above the Species Level Bernhard Rensch, 1960 Presents the English translation of Rensch's *Evolution Above the Species Level* which has been said to have given shape to the biological or synthetic theory of evolution

Flowering Plants George Ledyard Stebbins, 1974 Factors that determine evolutionary trends Trends of angiosperm phylogeny *Tempo and Mode in Evolution* for the National Academy of Sciences, 1995-02-26 Since George Gaylord Simpson published *Tempo and Mode in Evolution* in 1944 discoveries in paleontology and genetics have abounded This volume brings together the findings and insights of today's leading experts in the study of evolution including Ayala W Ford Doolittle and Stephen Jay Gould The volume examines early cellular evolution explores changes in the tempo of evolution between the Precambrian and Phanerozoic periods and reconstructs the Cambrian evolutionary burst Long neglected despite Darwin's interest in it species extinction is discussed in detail Although the absence of data kept Simpson from exploring human evolution in his book the current volume covers morphological and genetic changes in human populations contradicting the popular claim that all modern humans descend from a single woman This book discusses the role of molecular clocks the results of evolution in 12 populations of *Escherichia coli* propagated for 10 000 generations a physical map of *Drosophila* chromosomes and evidence for hitchhiking by mutations

Hierarchical Evolutionary-Developmental Theory Carlos Ochoa, 2025-06-23 This book introduces a new evolutionary model called Hierarchical Evolutionary Developmental Theory or H Evo Devo Theory This theory proposes that the organism's internal properties reflect entities that are highly integrated in developmental terms that evolve hierarchically In other words it attempts to demonstrate that developmental constraints operate at different scales producing distinct states of morphological stability reflected as subspecies species higher taxa and homologues all representing units of evolution In addition it reintroduces the concept of the organism in evolutionary biology supports a strictly macroevolutionary view and contemplates alternative evolutionary rates processes and mechanisms at different levels microevolution macroevolution megaevolution and modular evolution In short this book establishes a new synthesis between systematics morphology and evolution suggesting a significant shift in evolutionary thought The book comprises 1 A proposal for a new theory of evolution and systematics The H Evo Devo Theory reinterprets the concepts of subspecies species higher taxa and homologues proposing that the phylogenetic tree is built on a hierarchy of types developed from the top down in contrast to the traditional bottom up approach 2 A novel hierarchical perspective that reveals the underlying mechanisms acting on the patterns of divergence stability and extinction of the units of evolution 3 A resolution to the ontological problem regarding units of evolution e.g. the reality of species and higher taxa 4 A historical narrative that focuses on the development of a hierarchy theory of evolution grounded in the type concept and the significance of an organism centered perspective 5 A challenge to traditional frameworks that have sought to establish hierarchies in an evolutionary context 6 A challenge to classical evolutionary statements such as gradualism punctuated

equilibrium the extrapolationist premise and geographical models of speciation This book is written for those who feel that radical change is needed in evolutionary theory offering them a viable alternative **Encyclopedia of Biodiversity**

Handbook of Evolutionary Thinking in the Sciences Thomas Heams,Philippe Huneman,Guillaume Lecointre,Marc Silberstein,2014-11-23 The Darwinian theory of evolution is itself evolving and this book presents the details of the core of modern Darwinism and its latest developmental directions The authors present current scientific work addressing theoretical problems and challenges in four sections beginning with the concepts of evolution theory its processes of variation heredity selection adaptation and function and its patterns of character species descent and life The second part of this book scrutinizes Darwinism in the philosophy of science and its usefulness in understanding ecosystems whilst the third section deals with its application in disciplines beyond the biological sciences including evolutionary psychology and evolutionary economics Darwinian morality and phylolinguistics The final section addresses anti Darwinism the creationist view and issues around teaching evolution in secondary schools The reader learns how current experimental biology is opening important perspectives on the sources of variation and thus of the very power of natural selection This work examines numerous examples of the extension of the principle of natural selection and provides the opportunity to critically reflect on a rich theory on the methodological rigour that presides in its extensions and exportations and on the necessity to measure its advantages and also its limits Scholars interested in modern Darwinism and scientific research its concepts research programs and controversies will find this book an excellent read and those considering how Darwinism might evolve how it

can apply to the human sciences and other disciplines beyond its origins will find it particularly valuable Originally produced in French *Les Mondes Darwiniens* the scope and usefulness of the book have led to the production of this English text to reach a wider audience This book is a milestone in the impressive penetration by Francophone scholars into the world of Darwinian science its historiography and philosophy over the last two decades Alex Rosenberg R Taylor Cole Professor of Philosophy Duke University Until now this useful and comprehensive handbook has only been available to francophones Thanks to this invaluable new translation this collection of insightful and original essays can reach the global audience it deserves Tim Lewens University of Cambridge

Evolution, the Extended Synthesis Massimo Pigliucci, Gerd B. Müller, 2010-03-26 Prominent evolutionary biologists and philosophers of science survey recent work that expands the core theoretical framework underlying the biological sciences In the six decades since the publication of Julian Huxley's *Evolution: The Modern Synthesis* the spectacular empirical advances in the biological sciences have been accompanied by equally significant developments within the core theoretical framework of the discipline As a result evolutionary theory today includes concepts and even entire new fields that were not part of the foundational structure of the Modern Synthesis In this volume sixteen leading evolutionary biologists and philosophers of science survey the conceptual changes that have emerged since Huxley's landmark publication not only in such traditional domains of evolutionary biology as quantitative genetics and paleontology but also in such new fields of research as genomics and EvoDevo Most of the contributors to *Evolution: the Extended Synthesis* accept many of the tenets of the classical framework but want to relax some of its assumptions and introduce significant conceptual augmentations of the basic Modern Synthesis structure just as the architects of the Modern Synthesis themselves expanded and modulated previous versions of Darwinism This continuing revision of a theoretical edifice the foundations of which were laid in the middle of the nineteenth century the reexamination of old ideas proposals of new ones and the synthesis of the most suitable shows us how science works and how scientists have painstakingly built a solid set of explanations for what Darwin called the grandeur of life Contributors John Beatty Werner Callebaut Jeremy Draghi Chrisantha Fernando Sergey Gavrilets John C Gerhart Eva Jablonka David Jablonski Marc W Kirschner Marion J Lamb Alan C Love Gerd B Müller Stuart A Newman John Odling Smee Massimo Pigliucci Michael Purugganan E rs Szathm ry G nter P Wagner David Sloan Wilson Gregory A Wray

Macroevolution Emanuele Serrelli, Nathalie Gontier, 2015-02-13 This book is divided in two parts the first of which shows how beyond paleontology and systematics macroevolutionary theories apply key insights from ecology and biogeography developmental biology biophysics molecular phylogenetics and even the sociocultural sciences to explain evolution in deep time In the second part the phenomenon of macroevolution is examined with the help of real life history case studies on the evolution of eukaryotic sex the formation of anatomical form and body plans extinction and speciation events of marine invertebrates hominin evolution and species conservation ethics The book brings together leading experts who explain pivotal concepts such as Punctuated Equilibria Stasis Developmental Constraints

Adaptive Radiations Habitat Tracking Turnovers Mass Extinctions Species Sorting Major Transitions Trends and Hierarchies key premises that allow macroevolutionary epistemic frameworks to transcend microevolutionary theories that focus on genetic variation selection migration and fitness Along the way the contributing authors review ongoing debates and current scientific challenges detail new and fascinating scientific tools and techniques that allow us to cross the classic borders between disciplines demonstrate how their theories make it possible to extend the Modern Synthesis present guidelines on how the macroevolutionary field could be further developed and provide a rich view of just how it was that life evolved across time and space In short this book is a must read for active scholars and because the technical aspects are fully explained it is also accessible for non specialists Understanding evolution requires a solid grasp of above population phenomena Species are real biological individuals and abiotic factors impact the future course of evolution Beyond observation when the explanation of macroevolution is the goal we need both evidence and theory that enable us to explain and interpret how life evolves at the grand scale

Morphic Resonance Rupert Sheldrake, 2009-09-09 New updated and expanded edition of the groundbreaking book that ignited a firestorm in the scientific world with its radical approach to evolution Explains how past forms and behaviors of organisms determine those of similar organisms in the present through morphic resonance Reveals the nonmaterial connections that allow direct communication across time and space When A New Science of Life was first published the British journal Nature called it the best candidate for burning there has been for many years The book called into question the prevailing mechanistic theory of life when its author Rupert Sheldrake a former research fellow of the Royal Society proposed that morphogenetic fields are responsible for the characteristic form and organization of systems in biology chemistry and physics and that they have measurable physical effects Using his theory of morphic resonance Sheldrake was able to reinterpret the regularities of nature as being more like habits than immutable laws offering a new understanding of life and consciousness In the years since its first publication Sheldrake has continued his research to demonstrate that the past forms and behavior of organisms influence present organisms through direct immaterial connections across time and space This can explain why new chemicals become easier to crystallize all over the world the more often their crystals have already formed and why when laboratory rats have learned how to navigate a maze in one place rats elsewhere appear to learn it more easily With more than two decades of new research and data Rupert Sheldrake makes an even stronger case for the validity of the theory of formative causation that can radically transform how we see our world and our future

Allmon,Margaret M. Yacobucci,2016-10-05 Although the species is one of the fundamental units of biological classification there is remarkably little consensus among biologists about what defines a species even within distinct sub disciplines The literature of paleobiology in particular is littered with qualifiers and cautions about applying the term to the fossil record or equating such species with those recognized among living organisms In *Species and Speciation in the Fossil Record* experts in the field examine how they conceive of species of fossil animals and consider the implications these different approaches have for thinking about species in the context of macroevolution After outlining views of the Modern Synthesis of evolutionary disciplines and detailing the development within paleobiology of quantitative methods for documenting and analyzing variation within fossil assemblages contributors explore the challenges of recognizing and defining species from fossil specimens and offer potential solutions Addressing both the tempo and mode of speciation over time they show how with careful interpretation and a clear species concept fossil species may be sufficiently robust for meaningful paleobiological analyses Indeed they demonstrate that the species concept if more refined could unearth a wealth of information about the interplay between species origins and extinctions between local and global climate change and greatly deepen our understanding of the evolution of life *Developmental Plasticity and Evolution* Mary Jane West-Eberhard,2003-03-13 West Eberhard widely recognized as one of the most incisive thinkers in evolutionary biology assesses all the evidence for our current understanding of the role of changes in body plan and development for the process of speciation The process of evolution is systematically reassessed to integrate the insights coming from developmental genetics The Origin, Expansion, and Demise of Plant Species Donald A. Levin,2000-05-04 Combining insights from observation experimentation and theory *The Origin Expansion and Demise of Plant Species* offers a broad overview of species as dynamic entities that arise have unique evolutionary histories and ultimately go extinct It begins with a review of species

concepts and the exposition of a new concept it then addresses plant speciation the expansion of species from their narrow centers of origin intraspecific differentiation and contact zones between differentiated population systems Special attention is given to the breakdown of cohesion among populations by reproductive and spatial barriers Also the ecological and genetic properties of small populations and fragmented population systems are discussed with a focus on the role of hybridization in the demise of species It ends with an exploration of the longevity of species and the tempo of diversification contrasting different groups of plants in these respects as well as in rates of chromosomal differentiation This book provides a new synthesis of evolutionary biology and ecology It examines species from their origins then follows them through their expansion differentiation and loss of cohesion and decline and extinction The stages in the lives of species are viewed through ecological and genetic theory and topics typically addressed independently are woven into a continuous fabric As the first synthetic treatment of the stages through which plant species pass this book is very useful for botanists evolutionary biologists conservation biologists as well as all curious students of the biological sciences **Essential Developmental**
