Whitelaw, Gerald Robert Visgilio, 2005-05-27 Following a comprehensive overview by the editors this volume's expert contributors provide detailed discussion of important legal ecological and social issues associated with coastal resource management as well as the most significant challenges confronting land use planners and resource managers in coastal communities Using an interdisciplinary approach to perplexing questions surrounding the issue of development versus protection the volume presents a broad approach to coastal issues involving private rights and public trust Part I The Law and Coastal Environments provides background information on the more recent federal and state lawsuits statutes and regulations that impact coastal environments In Part II Ecological Consequences for Coastal Development scientists discuss threats posed by elevated nitrogen levels and heavy metal contamination in coastal waters followed by descriptions of the impact of development on habitats essential to estuarine dependent fish and migratory shorebirds In Part III Private Use Public Trust and Coastal Protection the authors explore ways to balance private use of the coast with public rights of access and preservation They discuss the concept of stewardship by both public and private landowners factors affecting environmental values in coastal communities and facilitation of enlightened public policies for growth management and resource protection Appropriate for courses pertaining to coastal ecology coastal management or land use planning this book will also appeal to a diverse audience of economists concerned citizens environmental lawyers and policymakers

Managed Realignment : A Viable Long-Term Coastal Management Strategy? Luciana S. Esteves, 2014-07-14 Managed realignment has been a preferred coastal management strategy in England in the 21st century and has also been increasingly implemented elsewhere Climate change and environmental and financial concerns have led to a shift from the traditional hold the line approach of coastal protection towards more flexible soft engineering options Managed realignment is a relatively new soft engineering alternative aiming to provide sustainable flood risk management with added environmental and socio economic benefits by creating space for coastal habitats to develop more dynamically The natural adaptive capacity of coastal habitats and the ecosystem services they provide underpin the sustainability of managed realignment However many definitions of managed realignment exist and the understanding of what the term actually represents in practice has evolved through time and varies regionally This book clarifies the definitions and terminology used in the literature and proposes that managed realignment is used as a general term that encompasses the many different methods of implementation worldwide including removal breach and realignment of defences controlled tidal restoration which includes regulated tidal exchange and controlled reduced tide and managed retreat These methods of implementation are explained

and illustrated with examples from around the world In addition to a general overview of emerging policies and current practices specific chapters discuss approaches adopted in different locations including the Netherlands the UK and Maui USA The UK experience is presented from the perspectives of three sectors the National Trust a charity organisation that owns 10% of the coastline of England and Wales the Environment Agency the organisation responsible for implementing government policy concerning flood and erosion risk and a private consultant involved in the planning design and delivery of managed realignment projects Taking a wider perspective to consider the range of implementation methods the viability of managed realignment as a long term coastal management strategy is discussed Recent national and regional strategies worldwide give managed realignment an increasing role in climate change and flood risk management Gaining stakeholders and public support is fundamental for the success of emerging coastal management strategies However public perception and stakeholders engagement are often cited as a factor limiting the wider uptake of managed realignment Results from a recent survey are used to benchmark the current thinking about the potential the performance and the limitations of managed realignment in the UK and elsewhere Current opinions about managed realignment are often not clearly defined partly due to many projects being relatively recent There is a general perception of great potential to provide sustainable flood risk management with added environmental benefits However the views of stakeholders are considerably more negative and notably contrast with the views of practitioners and researchers The only clear and dominant agreement across all groups of respondents is that better understanding about the long term evolution of sites is needed

English Coastal Evolution E. M. Ward,1922 *Coastal Evolution* R. W. G. Carter,C. D. Woodroffe,1994 A 1995 review of how shorelines have changed since the last Ice Age and what this implies for future environmental management Understanding the Long-Term Evolution of the Coupled Natural-Human Coastal System National Academies of Sciences, Engineering, and Medicine,Division of Behavioral and Social Sciences and Education,Division on Earth and Life Studies,Board on Environmental Change and Society,Ocean Studies Board,Board on Earth Sciences and Resources,Committee on Long-Term Coastal Zone Dynamics: Interactions and Feedbacks Between Natural and Human Processes Along the U.S. Gulf Coast,2018-10-17 The U S Gulf Coast provides a valuable setting to study deeply connected natural and human interactions and feedbacks that have led to a complex interconnected coastal system The physical landscape in the region has changed significantly due to broad scale long term processes such as coastal subsidence and river sediment deposition as well as short term episodic events such as hurricanes Modifications from human activities including building levees and canals and constructing buildings and roads have left their own imprint on the natural landscape This coupled natural human coastal system and the individual aspects within it physical ecological and human are under increased pressure from accelerating environmental stressors such as sea level rise intensifying hurricanes and continued population increase with its accompanying coastal development Promoting the resilience and maintaining the habitability of the Gulf Coast into the future

will need improved understanding of the coupled natural human coastal system as well as effective sharing of this understanding in support of decision making and policies Understanding the Long term Evolution of the Coupled Natural Human Coastal System presents a research agenda meant to enable a better understanding of the multiple and interconnected factors that influence long term processes along the Gulf Coast This report identifies scientific and technical gaps in understanding the interactions and feedbacks between human and natural processes defines essential components of a research and development program in response to the identified gaps and develops priorities for critical areas of research
