

Atmosphere - Air

The atmosphere is the layer of gases that surrounds the Earth. It is composed primarily of nitrogen (78%) and oxygen (21%), with small amounts of other gases such as carbon dioxide, water vapor, and ozone. The atmosphere plays a crucial role in regulating the Earth's temperature and climate, and is involved in processes such as the water cycle and the formation of weather patterns.

BIOSPHERE

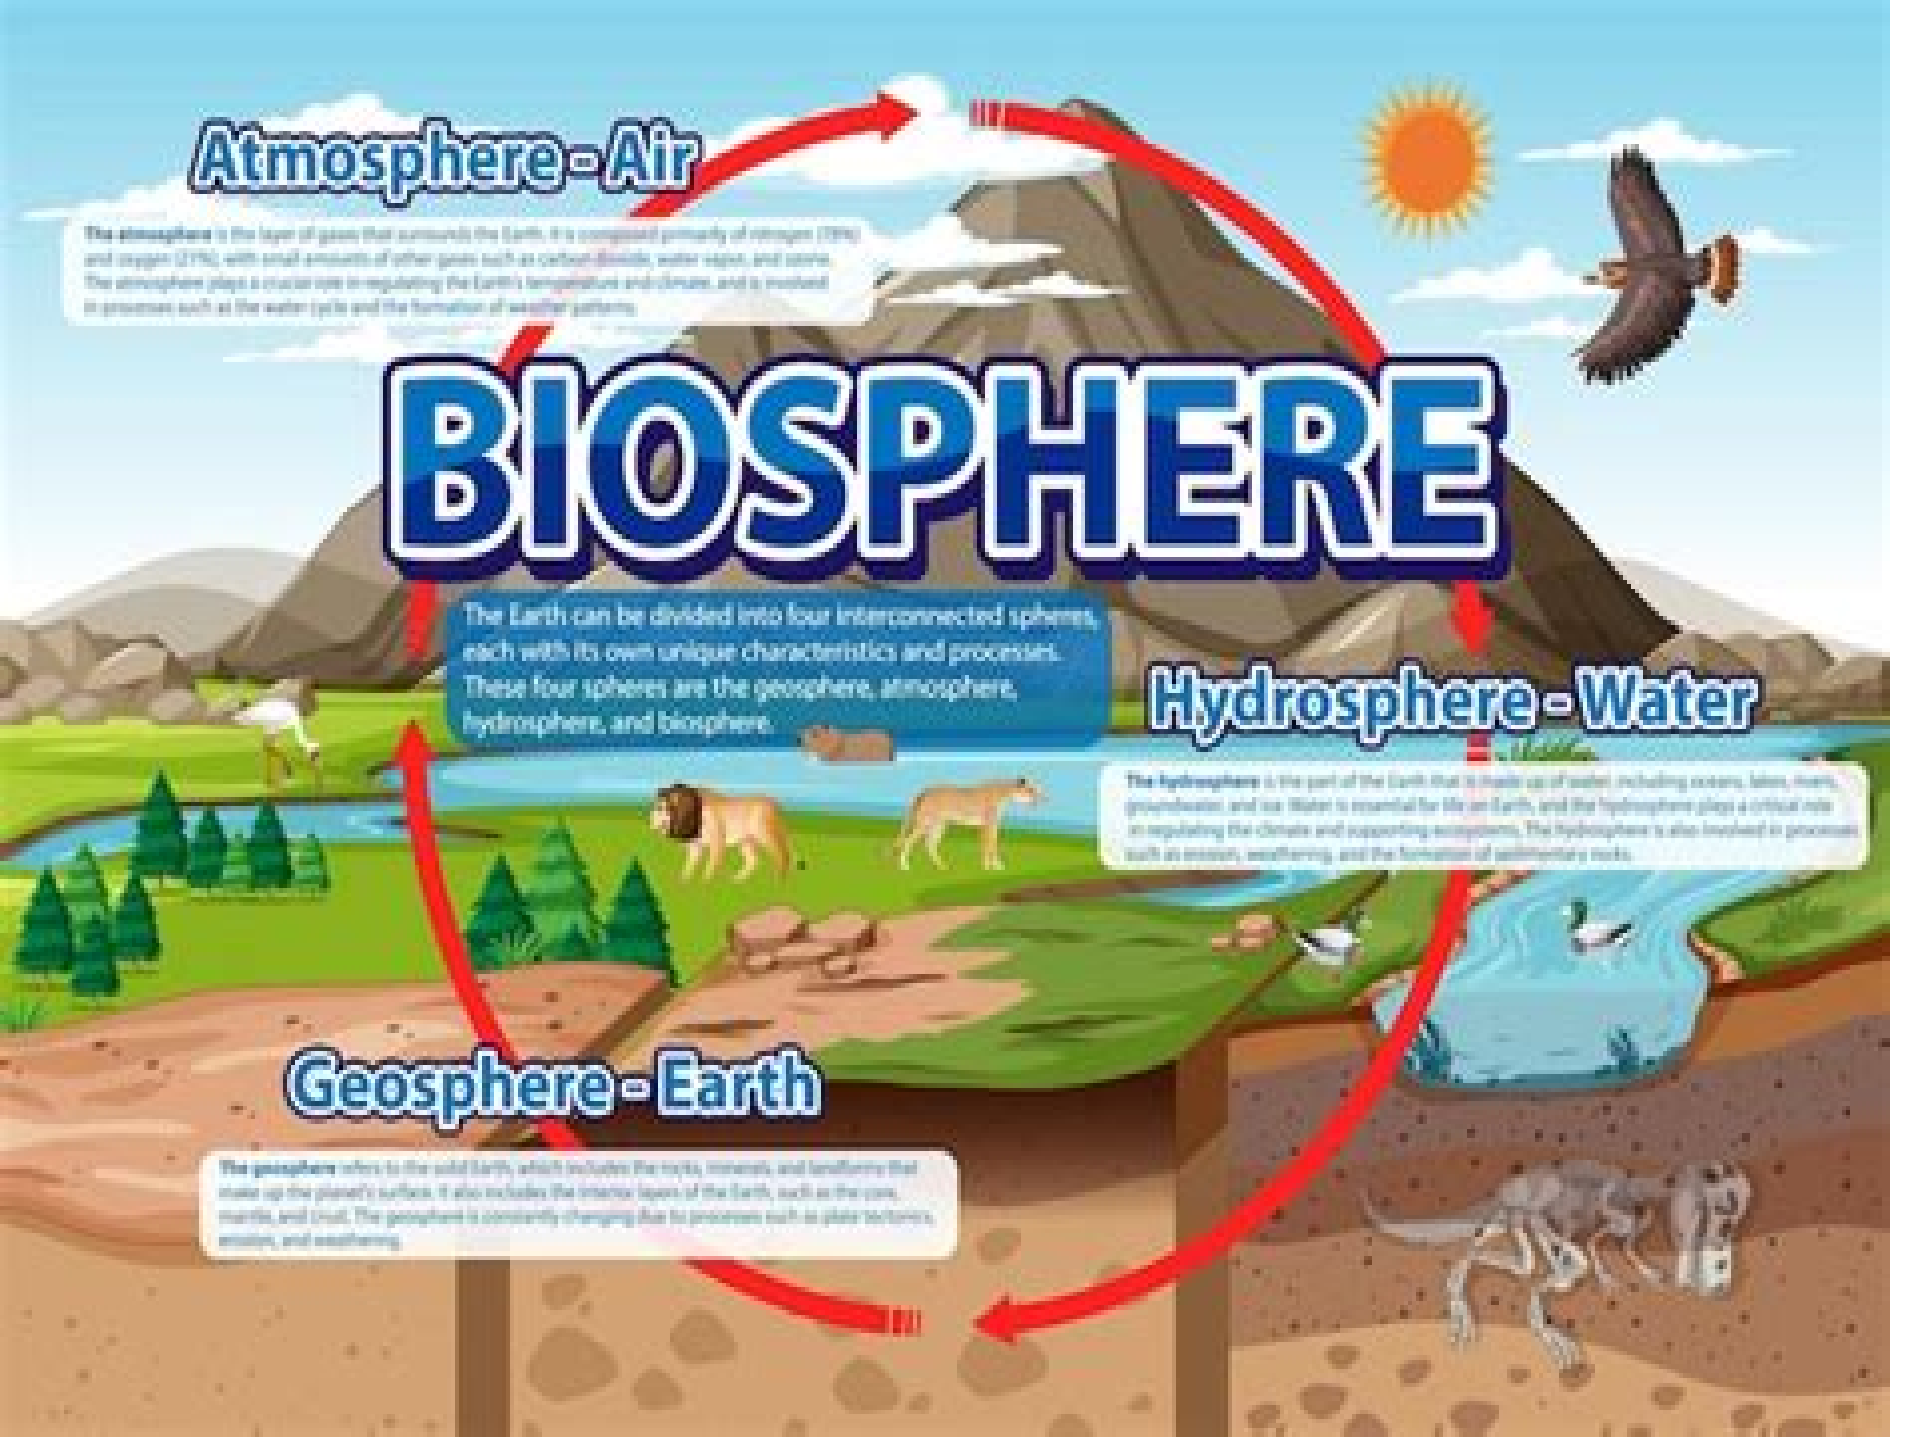

The Earth can be divided into four interconnected spheres, each with its own unique characteristics and processes. These four spheres are the geosphere, atmosphere, hydrosphere, and biosphere.

Hydrosphere - Water

The hydrosphere is the part of the Earth that is made up of water, including oceans, lakes, rivers, groundwater, and ice. Water is essential for life on Earth, and the hydrosphere plays a critical role in regulating the climate and supporting ecosystems. The hydrosphere is also involved in processes such as erosion, weathering, and the formation of sedimentary rocks.

Geosphere - Earth

The geosphere refers to the solid Earth, which includes the rocks, minerals, and landforms that make up the planet's surface. It also includes the interior layers of the Earth, such as the core, mantle, and crust. The geosphere is constantly changing due to processes such as plate tectonics, erosion, and weathering.
