Parvez, 2012-12-06 Rapid progress in analytical methods within the past few decades has led to the widespread applications of newer immunological and radioimmunoassay techniques to the diagnosis and treatment of hemorrhagic and thrombotic disorders Major advances were made to meet the multiple challenges of improving precision accuracy and availability of various measurements These advances have been paralleled by the discoveries of a close relationship between biological activities and the absolute concentration of proteins that were measured by immunological techniques This in turn assured the significance and usefulness of immunological methods in the management of patients Numerous variants of immunological tests now are available which allow us to both determine with precision minute quantities of antigenic proteins in serum and other biological fluids and differentiate the native protein from its genetically altered or degraded forms Methods also have been designed to immunologically evaluate some serine proteases that are in complex with proteolytic inhibitors Due to rapid progress in this field different laboratories unavoidably become experts in one or the other approach In the welter of possible choices the non expert usually is left to follow either the most recent but as yet to be confirmed method or his own anecdotal experience This manual not only brought together various methods in current use but it also set certain standardized criteria for the assessment of various deficiencies and abnormalities in hemostasis

**Chromatographic Methods** R. Stock, C. B. F. Rice, 2013-11-11 Classification of chromatographic methods

Chromatography is the name given to a particular family of separation techniques of great effectiveness The original method was described in 1903 by Tswett who used it for the separation of coloured substances and the name chromatography stems from this However the limitation to coloured compounds never really obtained and most chromatographic separations are nowadays performed on mixtures of colourless substances including gases Like fractional distillation chromatography relies on the relative movement of two phases but in chromatography one is fixed and is known as the stationary phase the other is

known as the mobile phase Chromatographic methods may be classified first according to the nature of the mobile phase and second according to the nature of the stationary phase The mobile phase may be a liquid or a gas and the stationary phase may be a solid or a liquid There are thus four main sub divisions of the chromatographic process as set out in Table 1 1 The system is called adsorption chromatography if the stationary phase is a solid and partition chromatography if it is a liquid
