People's health and the environment can be affected directly or indirectly by routine waste discharges or by accidents. A series of recent major industrial accidents and the effect of pollution highlighted once again the need for better management of routine and accidental risks. Moreover, the existence of natural hazards complicates even more the situation in any given region. In the past, efforts to cope with these risks, if made at all, have been largely on a plant-by-plant basis. Some plants are well equipped to manage environmental and health hazards while others are not. Managing the hazards of modern technological systems has become a key activity in highly industrialised countries. Decision makers are often confronted with complex issues concerning economic and social development, industrialisation and associated infrastructure needs, population and land use planning. Such issues have to be addressed in such a way that ensures that public health will not be disrupted or substantially degraded. Due to the increasing complexity of technological systems and the higher geographical density of potential hazard sources, new methodologies and a novel approach to these problems are challenging risk managers and regional planners. Risks from these new complex technological systems are inherently different from those addressed by the risk managers for decades ago. *Integrated Regional Risk Assessment, Vol. II* A.V. Gheorghe, M.

Nicolet-Monnier, 2013-06-29 Over recent years there has been an increasing awareness of the risks of locating hazardous industries near heavily populated environmentally sensitive areas. This new awareness demands a novel approach to safety planning for hazardous industries, one that looks at the problem from the point of view of integrated regional risk assessment, which besides the risks arising from natural events should also include the risks arising from the processing plants, storage and the transportation of dangerous goods. Volume I of *Integrated Regional Risk Assessment* highlights the main procedures for the assessment of risks to health and environmental impacts from continuous emissions of pollutants into air, water and soil under normal operating conditions. Volume II deals with the assessment of consequences of accidental releases, helping to answer such questions as: What can go wrong? What are the effects and consequences? How often will it happen? LIST The main procedural steps are supported by relevant internationally recognised methods of risk assessment. The book also reviews criteria and guidelines for the implementation of risk assessment and management at different stages. Audience: Students, engineers and scientists in charge of developing new methodologies for hazard analysis and risk assessment; practitioners of environmental protection; local and governmental authorities charged with implementing environmental risk impact procedures and guidelines. *Professional Risk and Working with People* Andy Bain, David Carson, 2008-01-15 *Professional Risk and Working with People* provides advice on assessing and managing risks for all those employed to take risks with or on behalf of other people. The authors explore issues of risk assessment and management that provides readers with a broad knowledge of risk practices that can be applied across a range of disciplines.
