**Differential Geometry** J. J. Stoker, 2011-09-09 This classic work is now available in an unabridged paperback edition Stoker makes this fertile branch of mathematics accessible to the nonspecialist by the use of three different notations vector algebra and calculus tensor calculus and the notation devised by Cartan which employs invariant differential forms as elements in an algebra due to Grassman combined with an operation called exterior differentiation Assumed are a passing acquaintance with linear algebra and the basic elements of analysis

Differential Geometry in Array Processing Athanassios Manikas, 2004 In view of the significance of the array manifold in

array processing and array communications the role of differential geometry as an analytical tool cannot be overemphasized Differential geometry is mainly confined to the investigation of the geometric properties of manifolds in three dimensional Euclidean space  $R^3$  and in real spaces of higher dimension Extending the theoretical framework to complex spaces this invaluable book presents a summary of those results of differential geometry which are of practical interest in the study of linear planar and three dimensional array geometries

*Introductory Differential Geometry For Physicists* A Visconti, 1992-10-09 This book develops the mathematics of differential geometry in a way more intelligible to physicists and other scientists interested in this field This book is basically divided into 3 levels level 0 the nearest to intuition and geometrical experience is a short summary of the theory of curves and surfaces level 1 repeats comments and develops upon the traditional methods of tensor algebra analysis and level 2 is an introduction to the language of modern differential geometry A final chapter chapter IV is devoted to fibre bundles and their applications to physics Exercises are provided to amplify the text material

**Elements of Neurogeometry** Jean Petitot, 2017-11-08 This book describes several mathematical models of the primary visual cortex referring them to a vast ensemble of experimental data and putting forward an original geometrical model for its functional architecture that is the highly specific organization of its neural connections The book spells out the geometrical algorithms implemented by this functional architecture or put another way the neurogeometry immanent in visual perception Focusing on the neural origins of our spatial representations it demonstrates three things firstly the way the visual neurons filter the optical signal is closely related to a wavelet analysis secondly the contact structure of the 1 jets of the curves in the plane the retinal plane here is implemented by the cortical functional architecture and lastly the visual algorithms for integrating contours from what may be rather incomplete sensory data can be modelled by the sub Riemannian geometry associated with this contact structure As such it provides readers with the first systematic interpretation of a number of important neurophysiological observations in a well defined mathematical framework The book's neuromathematical exploration appeals to graduate students and researchers in integrative functional cognitive neuroscience with a good mathematical background as well as those in applied mathematics with an interest in neurophysiology

**Elements of Functional Analysis** Francis Hirsch,Gilles Lacombe,2012-12-06 This book arose from a course taught for several years at the Univer sity of Evry Val d Essonne It is meant primarily for graduate students in mathematics To make it into a useful tool appropriate to their knowl edge level prerequisites have been reduced to a minimum essentially basic concepts of topology of metric spaces and in particular of normed spaces convergence of sequences continuity compactness completeness of ab stract integration theory with respect to a measure especially Lebesgue measure and of differential calculus in several variables The book may also help more advanced students and researchers perfect their knowledge of certain topics The index and the relative independence of the chapters should make this type of usage easy The important role played by exercises is one of the distinguishing fea tures of this work The exercises are very numerous and written in detail with hints that should allow the reader to overcome any difficulty Answers that do not appear in the statements are collected at the end of the volume There are also many simple application exercises to test the reader s understanding of the text and exercises containing examples and coun terexamples applications of the main results from the text or digressions to introduce new concepts and present important applications Thus the text and the exercises are intimately connected and complement each other Elements of dynamic science Illia Danilishyn,Oleksandr Danilishyn,2025-08-01 The monograph first task to understand hierarchy of energies in the Universe and the principles of functioning of living energy living

organism in particular human subtle energies and then using these principles to construct artificial living energies let's call them pseudo living energies It is possible to significantly expand the horizons of science in particular physics by studying the subtle energies in the Universe For this some aspects are proposed for consideration of Dynamic Science self science our theory science here acts as a space for the application of our theory in the self format i.e. any place of science in particular physics can act as a place for the location of the self It contains itself accommodates any action C in any place of science On the basis of mathematical uncertainties new mathematical structures are formed allowing us to describe processes and objects that are fundamentally not determined by conventional deterministic methods Objective uncertainties in any case can mean manifestations of processes and objects that are fundamentally not determined by conventional deterministic methods Many energies are indeterminate because they are based on uncertainties from the perspective of traditional science large concentrations of specific energy in a chaotic state The foundation of dynamic mathematics lies in working with uncertainties which makes it possible to manipulate these indeterminate energies using direct accumulative direct parallel neural networks The second task of the monograph is to construct a new mathematical apparatus for neural networks of a fundamentally new type direct parallel and direct accumulative action We construct models of singularities for singular work with them through neural networks analogues of the human CNS Ordinary regular work with them in ordinary science is fundamentally unable to realize their capabilities Therefore singular science realized on a neural network an analogue of the human CNS will be much more natural Unfortunately we do not have funding to perform the necessary experiments and the practical creation of a technical model of such a neural network There is a need to develop an instrumental mathematical base for new technologies The task of the work is to create new approaches for this by introducing new concepts and methods Our mathematics is unusual for a mathematician because here the fulcrum is the action and not the result of the action as in classical mathematics Therefore our mathematics is adapted not only to obtain results but also to directly control actions which will certainly show its benefits on a fundamentally new type of neural networks with directly parallel calculations for which it was created Any action has much greater potential than its result Social justice is fundamentally impossible as long as education training is based on achieving results and not on the process It is time for physicists to begin studying not only the manifestations of living energies but also the living energies themselves which are by no means expressed through objectivity and ordinary energies although they are capable of manifesting themselves through a lower level objectivity and ordinary energies We as mathematicians offer a new corresponding apparatus for understanding nature and studying living energies Significance of the article in a new qualitatively different approach to the study of complex processes through new mathematical hierarchical dynamic structures in particular those processes that are dealt with by Synergetics The significance of our article is in the formation of the presumptive mathematical structure of subtle energies this is being done for the first time in science and the presumptive classification of the mathematical structures of subtle

energies for the first time The experiments of the 2022 Nobel laureates Asle Ahlen John Clauser Anton Zeilinger and the experiments in chemistry Nazhipa Valitov eloquently demonstrate that we are right and that these studies are necessary Be that as it may we created classes of new mathematical structures new mathematical singularities i e made a contribution to the development of mathematics

Encyclopaedia of Mathematics Michiel Hazewinkel, 2012-12-06 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977 1985 The annotated translation consists of ten volumes including a special index volume There are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions The second kind of article of medium length contains more detailed concrete problems results and techniques
