## **Collective Diffusion on Surfaces: Correlation Effects and Adatom Interactions**

M.C. Tringides, Z. Chvoj, 2012-12-06 As materials research focuses into finding ways to control the growth of atomic scale structures there is correspondingly increasing emphasis on to the problem of surface diffusion Clearly surface diffusion is the key process which determines how atoms move on the surface Controlling this motion can lead to the easy fabrication of well controlled nanostructures broadening the present possibilities in nanotechnology The paradigm of surface diffusion has outgrown its standard textbook description as a random walk on a rigid substrate In real systems for more complex situations are encountered interacting atoms are commonly present on the surface with their motions highly correlated different phases form on the surface with different dynamics large concentration gradients drive the system far away from the linear response regime rich metastable structures form as a result of balanced interplay between different kinetic processes substrate relaxation can change the energy landscape and the diffusion barriers etc The motivation behind this ARW was to bring together the international community working on these problems We felt that the large number of researchers new results and well formulated open questions in this area require some form of integration in a single forum The ARW and the upcoming proceedings book with papers by the majority of the participants has provided this forum The meeting was not planned as a continuation of the earlier NATO ASI in Rhodes in 1996 although several people have participated in both meetings

*Fluctuations and Order* Mark Millonas, 2012-12-06 The volume that you have before you is the result of a growing realization that fluctuations in nonequilibrium systems play a much more important role than was first believed It has become clear that in nonequilibrium systems noise plays an active one might even say a creative role in processes involving self organization pattern formation and coherence as well as in biological information processing energy

transduction and functionality Now is not the time for a comprehensive summary of these new ideas and I am certainly not the person to attempt such a thing Rather this short introductory essay and the book as a whole is an attempt to describe where we are at present and how the viewpoint that has evolved in the last decade or so differs from those of past decades Fluctuations arise either because of the coupling of a particular system to an external unknown or unknowable system or because the particular description we are using is only a coarse grained description which on some level is an approximation We describe the unpredictable and random deviations from our deterministic equations of motion as noise or fluctuations A nonequilibrium system is one in which there is a net flow of energy There are as I see it four basic levels of sophistication or paradigms concerning fluctuations in nature At the lowest level of sophistication there is an implicit assumption that noise is negligible the deterministic paradigm

*Cohesion and Structure of Surfaces* K. Binder, M. Bowker, J.E. Inglesfield, P.J. Rous, 1995-12-18 During the past fifteen years there has been a dramatic increase in the number of different surfaces whose structures have been determined experimentally For example whereas in 1979 there were only 25 recorded adsorption structures to date there are more than 250 This volume is therefore a timely review of the state of the art in this dynamic field Chapter one contains a compilation of the structural data base on surfaces within a series of tables that allows direct

comparison of structural parameters for related systems Experimental structural trends amongst both clean surfaces and adsorbate systems are highlighted and discussed The next chapter outlines the successes of local density functional theory in predicting the relaxations and reconstructions of clean metal and semiconductor surfaces and the behaviour of adsorbates such as hydrogen oxygen and alkali elements on metal surfaces thereby explaining some of the experimental trends observed within the database These ab initio density functional calculations are of ground state properties at the absolute zero of temperature Chapter three provides an introduction to finite temperature effects in a pedagogical review of current statistical mechanical treatments of phase transitions at surfaces many of which display the prominent role of fluctuations or non mean field behaviour The final chapter discusses the relationship of the reactivity of a surface to its morphology and composition which is particularly relevant to a fundamental understanding of catalysis

*An Introduction to Kinetic Monte Carlo Simulations of Surface Reactions* A.P.J. Jansen, 2012-05-31 Kinetic Monte Carlo kMC simulations still represent a quite new area of research with a rapidly growing number of publications Broadly speaking kMC can be applied to any system describable as a set of minima of a potential energy surface the evolution of which will then be regarded as hops from one minimum to a neighboring one The hops in kMC are modeled as stochastic processes and the algorithms use random numbers to determine at which times the hops occur and to which neighboring minimum they go Sometimes this approach is also called dynamic MC or Stochastic Simulation Algorithm in particular when it is applied to solving macroscopic rate equations This book has two objectives First it is a primer on the kMC method predominantly using the lattice gas model and thus much of the book will also be useful for applications other than to surface reactions Second it is intended to teach the reader what can be learned from kMC simulations of surface reaction kinetics With these goals in mind the present text is conceived as a self contained introduction for students and non specialist researchers alike who are interested in entering the field and learning about the topic from scratch
