**Mathematical Methods and Models in Phase Transitions** Alain Miranville, 2005 The modelling and the study of phase transition phenomena are capital issues as they have essential applications in material sciences and in biological and industrial processes We can mention e g phase separation in alloys ageing of materials microstructure evolution crystal growth solidification in complex alloys surface diffusion in the presence of stress evolution of

the surface of a thin flow in heteroepitaxial growth motion of voids in interconnects in integrated circuits treatment of airway closure disease by surfactant injection fuel injection fire extinguishers etc This book consists of 11 contributions from specialists in the mathematical modelling and analysis of phase transitions The content of these contributions ranges from the modelling to the mathematical and numerical analysis Furthermore many numerical simulations are presented Finally the contributors have tried to give comprehensive and accurate reference lists This book should thus serve as a reference book for researchers interested in phase transition phenomena

**Fundamental Models in Financial Theory** Doron Peleg, 2014-04-11 Understanding and applying complex modern financial models in real life scenarios including the Black Litterman model for constructing an optimal portfolio while incorporating personal views This book provides an innovative integrated and methodical approach to understanding complex financial models integrating topics usually presented separately into a comprehensive whole The book brings together financial models and high level mathematics reviewing the mathematical background necessary for understanding these models organically and in context It begins with underlying assumptions and progresses logically through increasingly complex models to operative conclusions Readers who have mastered the material will gain the tools needed to put theory into practice and incorporate financial models into real life investment financial and business scenarios Modern finance's most bothersome shortcoming is that the two basic models for building an optimal investment portfolio Markowitz's mean variance model and Sharpe and Treynor's Capital Asset Pricing Model CAPM fall short when we try to apply them using Excel Solver This book explores these two models in detail and for the first time in a textbook the Black Litterman model for building an optimal portfolio constructed from a small number of assets developed at Goldman Sachs is thoroughly presented The model's integration of personal views and its application using Excel templates are demonstrated The book also offers innovative presentations of the Modigliani Miller model and the Consumption Based Capital Asset Pricing Model CCAPM Problems at the end of each chapter invite the reader to put the models into immediate use *Fundamental Models in Financial Theory* is suitable for classroom use or as a reference for finance practitioners
