Growth, Differentiation and Sexuality Friedhelm Meinhardt, Joseph G.H. Wessels, 2013-04-17 Mycology the study of fungi originated as a subdiscipline of botany and was a descriptive discipline largely neglected as an experimental science until the early years of this century A seminal paper by Blakeslee in 1904 provided evidence for self incompatibility termed heterothallism and stimulated interest in studies related to the control of sexual reproduction in fungi by mating type specificities Soon to follow was the demonstration that sexually reproducing fungi exhibit Mendelian inheritance and that it was possible to conduct formal genetic analysis with fungi The names Burgeff Kniep and Lindegren are all associated with this early period of fungal genetics research These studies and the discovery of penicillin by Fleming who shared a Nobel Prize in 1945 provided further impetus for experimental research with fungi Thus began a period of interest in mutation induction and analysis of mutants for biochemical traits Such fundamental research conducted largely with *Neurospora crassa* led to the one gene one enzyme hypothesis and to a second Nobel Prize for fungal research awarded to Beadle and Tatum in 1958 Fundamental research in biochemical genetics was extended to other fungi especially to *Saccharomyces cerevisiae* and by the mid 1960s fungal systems were much favored for studies in eukaryotic molecular biology and were soon able to compete with bacterial systems in the molecular arena

Growth, Differentiation and Sexuality Ursula Kües, Reinhard Fischer, 2006-07-19 Since publication of the first edition of Volume I in 1994 the field of fungal biology has developed tremendously mainly through the advancement of various molecular techniques and international fungal genome projects To accommodate these developments the second edition has been completely updated Six chapters have been revised by former authors others by newly recruited experts and also novel subjects emerged in more recent years have been added to the book Leading scientists in the field have compiled comprehensive overviews as well as latest results obtained from cytological genetic and molecular studies Topics include cellular and colony growth of fungi cellular fusion and incompatibility senescence and programmed cell death environmental and physiological signalling in differentiation processes asexual and sexual reproduction mitosis and meiosis of various types of fungi Both parallels and differences become visible between individual fungi as well as between fungal

classes *Food Preservation Techniques* Peter Zeuthen, Leif Bøgh-Sørensen, 2003-10-30 Extending the shelf life of foods whilst maintaining safety and quality is a critical issue for the food industry As a result there have been major developments in food preservation techniques which are summarised in this authoritative collection The first part of the book examines the key issue of maintaining safety as preservation methods become more varied and complex The rest of the book looks both at individual technologies and how they are combined to achieve the right balance of safety quality and shelf life for particular products Provides an authoritative review of the development of new and old food preservation technologies and the ways they can be combined to preserve particular foods Examines the emergence of a new generation of natural preservatives in response to consumer concerns about synthetic additives Includes chapters on natural antimicrobials bacteriocins and antimicrobial enzymes as well as developments in membrane filtration ultrasound and high hydrostatic pressure

Spectroscopy of Biological Molecules: New Directions Jan Greve, Gerwin Jan Puppels, Cees Otto, 2012-12-06 Investigation of the structure and function of biological molecules through spectroscopic methods is a field rich in revealing clever techniques and demanding experiments It is most gratifying to see that the basic concepts are applied to more and more complex systems making feasible the study of the behaviour of whole systems in relation to molecular disturbances The analytical potential of spectroscopy and spectroscopic imaging enables species identification of bacteria and tissue recognition Clear opportunities for in vivo applications become apparent in the medical field The methods developed in biophysics start to generate spin off in the direction of biotechnology where in previous years we have seen this happen for biochemical techniques New directions are manifest Tools are being developed to investigate the behaviour of single molecules in interaction with their environment Individual interactions can now be investigated and individual molecules in complexes can be visualized Processes that were previously unobservable as a result of ensemble averaging can now be investigated on a single molecule level Completely new information with regard to molecular behaviour is obtained in this way The insights amaze us and the prospect that this development will continue is exciting The 8th European Conference on the Spectroscopy of Biological Molecules is proud to have contributed to the dissemination of these new directions This proceedings book is an appropriate reflection of the progress obtained so far in the spectroscopy of biological molecules
