disease often includes molecular markers and as a result the content of molecular and genetic data is included whenever it is required for neuropathological classification. The seventh edition now includes immunohistochemical in situ identification of abnormal proteins or abnormal distribution of proteins in neuropathology. Gene sequencing or mutated constructs permits the identification of specific gene mutations and has led to considerable advances in the understanding and classification of degenerative neoplastic and developmental diseases. In fact, molecular and genetic data are now a crucial component of the defining criteria for the diagnosis and classification of intracranial tumors, data that is essential for the neuro oncologist, neurosurgeon, and radiation therapist to determine prognosis and optimal personalized treatments. The classification of brain tumors has also been updated by the World Health Organization in 2021. Genetic data have also completely changed the understanding, classification, and diagnosis of hereditary metabolic disorders as well as many classes of myopathies and neuropathies. Newly emerging diseases in the Seventh Edition include chronic traumatic encephalopathy associated with repeated head trauma, late onset cognitive disorders including PART and LATE, and new viral syndromes including COVID and Zika virus. Throughout the Manual, it draws on a world wide expertise with authors from four continents collaborating to provide a remarkable breadth of experience.
