Visual Pollution Adriana Portella, 2016-02-11 In recent years there has been

considerable interest in the problems that public spaces face because of the design of commercial signs. The negative consequences that commercial signs can have on the visual quality of urban areas and further more on people's quality of life has been studied from both architectural planning and psychological perspectives. While the issue of visual pollution as this phenomenon is commonly described has been widely debated, there is as yet no clear conclusion as to how best to control commercial signage and whether different urban contexts and people from different backgrounds and cultures have universal or distinct preferences. Several different commercial signage approaches are currently applied to different historic cities but these initiatives are not based on principles derived from the perception and evaluation of users. Drawing on a range of comparative and contrasting empirical studies of historic city centres in the UK and Brazil, this book examines questions of commercial signage control, management, the preservation of historic heritage and user preference and satisfaction. The author takes an environment-behaviour approach to this research involving theories, concepts and methodologies related to environmental psychology, architecture, planning and urban design. In doing so, it argues that there are in fact visual preferences common to the majority of people independent of their urban context and that these common views can be useful to the development of a general theory of how to control commercial signage. In conclusion, the book suggests that the best way of controlling signage is not only to recommend general guidelines related to the operation of commercial signage but also to recommend design principles that can create commercial streetscapes evaluated positively by different users.

Designing Cities Leonhard Schenk, 2023-02-20. Manual for Urban Design. Second and revised edition of the successful edition with new projects. Urban design is based on planning and design principles that need to meet functional demands on the one hand but on the other hand bring the design elements together into a distinctive whole. The basic compositional principles are for the most part timeless. *Designing Cities* examines the most important design and presentation principles of urban design using historical examples and contemporary international competition entries designed by practices including Foster Partners, KCAP Architects Planners, MVRDV and OMA. At the core of the publication is the question of how the projects were designed and what methods and tools were available to the designer such as parametric design in which variable parameters automatically influence the design and provide a range of possible solutions. Tools for urban design. Current projects and award-winning competition entries by renowned international practices. A textbook for students and a practical design aid for practicing architects and planners.

The Vertical City K. Al-Kodmany, 2018-06-25. Each century has its own unique approach toward addressing the problem of high density and the 21st century is no exception. As cities try to cope with rapid population growth, adding 2.5 billion dwellers by 2050 and grapple with destructive sprawl, politicians, planners and architects have become increasingly interested in the vertical city paradigm. Unfortunately, cities all over the world are grossly unprepared for integrating tall buildings as these buildings may aggravate multidimensional sustainability challenges resulting in a vertical sprawl that could have worse consequences than horizontal sprawl. By using extensive data and
