Fundamentals of Immunology Otto G. Bier, Wilmar Dias Da Silva, Dietrich Götze, Ivan

Mota,2012-12-06 The good acceptance of this textbook is an indication that it has served its purpose The present edition has been prepared in order to cover the main progress achieved in the five years that have elapsed since the first edition The structure of the book remains essentially the same but a considerable amount of new material has been introduced particularly in certain areas such as the genetics of immunoglobulins and T cell receptor the regulation of the immune response hypersensitivity reactions and cellular immunology Today immunology is essential for biologists in general and in particular for physicians veterinarians and pathologists The great progress and diversification that has taken place in the last few years is due to its enormous value both for the understanding of theoretical biology and for the practical resolution of biochemical genetic pathological and biological problems Greatly contributing to this progress have been relatively sophisticated techniques such as immunofluorescence radioimmune assay transmission electron microscopy scanning electron microscopy isoelectric focusing quantitative cytofluorimetry affinity chromatography and techniques that allow separation of the different lymphocyte subpopulations A potentially fabulous field was recently opened with the development of techniques for obtaining monoclonal antibodies by fusion of immunologically active lymphocytes with myeloma cells These hybrid cells produce large amounts of monoclonal antibodies or other lymphocyte factors The establishment of this hybridoma technology that is already routine in most laboratories is being used in the resolution of general biology problems particularly in the study of the various cell surface molecules Fundamental Immunology William E. systems have inbuilt immune mechanisms by which humans survive the prevalent infections caused by the common bacteria located in almost every environment of man's involvement. The fact of immunity is not an artificial health aspect built on man's innovations in science but rather a natural fundamental of human life and therefore this provides the basis of preventive health and immunization. Body immunity refers to the process or phenomenon through or by which the living body system is capable of identifying, isolating the foreign intruding harmful microorganisms and destroy or disarm them of the toxins that would be hazardous to the normal functioning of the body. The ability of the body to activate immunity against harmful microbes determines the health status of an individual and this is the foundation of immunology which is a perspective study directed against infectious disease spread in human communities. Immunology which is a basic subject in medical sciences finds its purpose along with microbiology infectious disease control. In consortium with these medical subjects immunology is regarded as the study of the fundamental physiological body components molecules tissues cells organs and systems that are responsible of isolating foreign harmful bodies and disposing them out. The significance of immunology in the health science world is that it explores the common trends of disease emergence with an intention not of epidemiological importance but far more to devise vaccination which can be applicable to prevent it from continuity. Through this conceptual and systematic study of immunology the fundamental constituents of human immunity system their functional pathways regeneration and replacement are analyzed. The study paper also entails the significance of immunology in the public health strategies of reducing health inequalities and disparities in the international community through international conventions on health policy structuring such as immunization are idealized.
