Economics Of Climate Change:

The Economics of Climate Change and the Change of Climate in Economics Kevin Maréchal, 2013-05-02 Climate change is without question the single most important issue the world faces over the next hundred years. The most recent scientific data have led to the conclusion that the globally averaged net effect of human activities since 1750 has been one of warming and that continued greenhouse gas emissions at or above current rates would cause this process to continue to the severe detriment of our environment. This unequivocal link between climate change and human activity requires an urgent world wide shift towards a low carbon economy and coordinated policies and measures to manage this transition. The starting point and core idea of this book is the long held observation that the threat of climate change calls for a change of climate in economics. Inherent characteristics of the climate problem including complexity, irreversibility and deep uncertainty challenge core economic assumptions and mainstream economic theory appears inappropriately equipped to deal with this crucial issue. Kevin Maréchal shows how themes and approaches from evolutionary and ecological economics can be united to provide a theoretical framework that is better suited to tackle the problem.

The Economics of Climate Change Nick Hanley, Anthony D Owen, 2004-05-06 With global warming now becoming physically noticeable and the Kyoto treaty stalling in its efforts to get the developed world on board, this look at the economic factors of global warming is very much welcome.

The Economics of Climate Change in China Fan Gang, Nicholas Stern, Ottmar Edenhofer, Xu Shanda, Klas Eklund, Frank Ackerman, Lailai Li, Karl Hallding, 2013-09-13 China faces many modernization challenges but perhaps none is more pressing than that posed by climate change China must find a new economic growth model that is simultaneously environmentally sustainable can free it from its dependency on fossil fuels and lift living standards for the majority of its population But what does such a model look like And how can China best make the transition from its present macro economic structure to a low carbon future This ground breaking economic study led by the Stockholm Environment Institute and the Chinese Economists 50 Forum brings together leading international thinkers in economics climate change and development to tackle some of the most challenging issues relating to China s low carbon development This study maps out a deep carbon reduction scenario and analyzes economic policies that shift carbon use and shows how China can take strong and decisive action to make deep reductions in carbon emission over the next forty years while maintaining high economic growth and minimizing adverse effects of a low carbon transition Moreover these reductions can be achieved within the finite global carbon budget for greenhouse gas emissions as determined by the hard constraints of climate science The authors make the compelling case that a transition to a low carbon economy is an essential part of China s development and modernization Such a transformation would also present opportunities for China to improve its energy security and move its economy higher up the international value chain They argue that even in these difficult economic times climate change action may present more opportunities than costs Such a transformation for China and the

rest of the world will not be easy But it is possible necessary and worthwhile to pursue Can We Afford the Future? Frank Ackerman, 2009-04-15 According to many scientists climate change is a growing threat to life as we know it requiring a large scale immediate response According to many economists climate change is a moderately important problem the best policy is a slow gradual start to avoid spending too much They can't both be right In this book Frank Ackerman offers a refreshing look at the economics of climate change explaining how the arbitrary assumptions of conventional theories get in the way of understanding this urgent problem The benefits of climate protection are vital but priceless and hence often devalued in cost benefit calculations Preparation for the most predictable outcomes of global warming is less important than protection against the growing risk of catastrophic change massive investment in new low carbon technologies and industries should be thought of as life insurance for the planet Ackerman makes an impassioned plea to construct a better economics arguing that the solutions are affordable and the alternative is unthinkable If we can't afford the future what are we saving our money for Can we Afford the Future is part of The New Economics series which uses the ideas behind a new more human economics to provide a fresh way of looking at major contemporary issues Managing the Global Commons William D. Nordhaus, 1994-10-04 Provides a detailed analysis of the DICE model Dynamic Integrated model of Climate and the Economy as well as an extensive analysis of the model's results Climate Change and Economics S. Niggol Seo, 2021-03-29 This textbook provides a broad introduction to the relationship between climate change economics and climate policy for young readers and future generations It highlights the problem of intergenerational gaps and burden sharing on climate change Taking on major contentious issues of today it is rich with behavioural strategies and real life experiences which are explained in an accessible and engaging way A diverse range of topics are covered including farm animals of Sub Sahara Latin American rainforests Indian monsoon agriculture tropical cyclones in Bangladesh sublime grasslands energy revolutions hydroelectric dams of China backstop technologies ocean exchanges with the atmosphere mass extinction of species commercial fisheries infectious diseases and pandemics and a climate policy big deal Climate Change and Economics Engaging with Future Generations with Action Plans aims to engage with young readers and offer action plans for activists It is relevant to students interested in environmental economics and environmental science Climate Economics Michael Roos, Franziska M. Hoffart, 2020-11-13 This book is a philosophical critique of the economics of climate change from both an ethical and philosophy of economics perspective Mitigating climate change is not so much a scientific problem but rather a political social and above all an economic problem A future without greenhouse gas emissions requires a radical transformation towards a sustainable low carbon economy and society How this transformation could be achieved raises numerous economic questions Many of these questions remain untouched although economists are equipped with a suitable toolkit and expertise This book argues that economists have a social responsibility to carry out more research on how global warming could be stopped and that ultimately economic analysis of climate change must be a political economic approach

that treats the economy as part of a wider social system This approach will be of interest to policy makers educators students and researchers in support of more pluralism in economic research and teaching

FitzRoy, Elissaios Papyrakis, 2009-12-01 Interest in climate change has generated a mountain of literature leaving many floundering in the sheer flood of information commentary claims and initiatives This highly accessible book assumes no prior knowledge and cuts through the confusion to explain the key economic and policy issues related to climate change in simple language and with only a few statistics Coverage slices across the breadth and depth of climate change providing short summaries of the most relevant research and conclusions from various disciplines The authors highlight where economists and policy makers generally misunderstand the science of climate change underestimate the risks of runaway warming and exaggerate the costs of radical measures to stabilize the climate A key focus is the impact of climate change on world agriculture the world's most important activity The authors provide a critical examination of how current policies that promote poor water usage and soil erosion are risking a catastrophic collapse of agriculture in the poorest and most populous countries in a warming world They look at the solutions such as how no till conservation farming third generation biofuels from waste land alternative energy and bio char production to raise sustainable yields reduce emissions and sequester carbon in soil The second crucial thrust is a critical examination of the growth economy paradigm of rich countries that is driving climate change The authors look at economic measures to control climate change including switching taxes from labour to carbon and subsidies from fossil and nuclear energy to renewable alternatives as well as demand management and energy saving Overall the book provides a comprehensive critical introduction to the issues and highlights the main policies that are needed to initiate the transformation to sustainability and avert the worst risks of climate catastrophe
