Ecosystem Succession A General Hypothesis And A Test Model Of A Grassland:

Ecosystem Succession Luis T. Gutierrez, Willard R. Fey, 2003-02-01 Natural ecosystems such as lakes grasslands and forests undergo succession from their early stages of development to maturity when the community of plants and animals achieves a condition of equilibrium with its physical environment Because ecosystems succeed in response to either natural or man made disturbances it is important to understand how successional behavior arises and how to control it to avoid permanent deterioration of systems indispensable for our survival Understanding how to use succession as a constructive ecological force is particularly important as short supplies and rising costs of fossil fuels inhibit the intensive use of ecosystems for food production Ecologists and land use managers as well as system dynamics students and practitioners will be interested in this quantitative analysis of dynamic ecological processes The authors are engineers who share the conviction that system dynamics provides a methodology that is particularly applicable to analysis and modeling of large scale ecosystems so that better utilization policies can be designed In this book they integrate the available empirical evidence on succession into a dynamic model that accounts for successional modes of behavior as they arise from the internal structure of the ecosystem The model is fully documented so that each assumption and parameter can be reviewed and criticized by the reader

Analysis of Ecological Systems: State-of-the-Art in Ecological Modelling W.K. Lauenroth, G.V. Skogerboe, M. Flug, 2013-10-22 The International Society for Ecological Modelling ISEM sponsors conferences workshops and training courses with the aim of advancing the development of ecological and environmental modelling The 3rd International Conference on the state of the art in ecological modelling was sponsored by the ISEM in cooperation with the National Park Service Water Resources Laboratory and hosted by the Natural Resource Ecology Laboratory at Colorado State University Its theme was the application of ecological modelling to environmental management and this book contains the full texts of the three invited papers presented in the five general sessions plus the final summaries and syntheses of the topics covered during those sessions

The Background of Ecology Robert P. McIntosh, 1986-09-26 The Background of Ecology is a critical and up to date review of the origins and development of ecology with emphasis on the major concepts and theories shared in the ecological traditions of plant and animal ecology limnology and oceanography The work traces developments in each of these somewhat isolated areas and identifies where possible parallels or convergences among them Dr McIntosh describes how ecology emerged as a science in the context of nineteenth century natural history

Ecosystems Succession Luis T. Gutierrez, Willard R. Fey, 1980 *Vegetation dynamics in grasslands, heathlands and mediterranean ligneous formations* P. Poissonet, F. Romane, M.A. Austin, E. van der Maarel, 2012-12-06 Symposium of the Working Group for Succession Research on Permanent Plots and Data Processing of the International Society for Vegetation Sciences Held at Montpellier France September 1980 Holocene Human Ecology in Northeastern North America George P. Nicholas, 2013-06-29 Students of human behavior have always been interested in

the relationship between human populations and their environment Decades of research not only have illuminated the backdrop against which culture is viewed but have identified many of the conditions that influence or promote technological development social transformation and economic reorganization It has become increasingly evident however that if we are to explore more forcefully the linkages between culture and environment a processual orientation is required This is found in human ecology the study of the relationship between people and the ecosystem of which they are a part This book is a collection of papers about the recent and distant past by scientists and humanists involved in the study of human ecology in northeastern North America The authors critically examine the systemic interface between people and their environment first by identifying the indicators of that relationship e g historical documentation archaeological site patterning faunal remains then by defining the processes by which change in one part of the ecosystem affects other parts e g by considering how an ecotonal gradient affects biotic communities over time and finally by explicating the behavioral implications thereof

Positive Feedback in Natural Systems Donald L. DeAngelis, Wilfried M. Post, Curtis C. Travis, 2012-12-06 Cybernetics a science concerned with understanding how systems are regulated has reflected the preoccupations of the century in which it was born Regulation is important in twentieth century society where both machines and social organizations are complex Cybernetics focused on and became primarily associated with the homeostasis or stability of system behavior and with the negative feedbacks that stabilize systems It paid less attention to the processes opposite to negative feedback the positive feedback processes that act to change systems We attempt to redress the balance here by illustrating the enormous importance of positive feedbacks in natural systems In an article in the American Scientist in 1963 Maruyama called for increased attention to this topic noting that processes of change could occur when a deviation in any one component of the system caused deviations in other components that acted back on the first component to reinforce or amplify the initial deviation The deviation amplification is the result of positive feedback among system components Maruyama demonstrated by numerous examples that the neglect of such processes was unjustified and suggested that a new branch of cybernetics the second cybernetics be devoted to their study
