Insect Endocrinology Bronisław Cymborowski, 1992 The endocrinological control of the numerous processes associated with the physiology and development of insects has been the subject of extensive research during the past decade This monograph presents a wide range of information on the insect endocrine system Particular attention is given to the mechanism of action of insect hormones during growth and metamorphosis with special reference to the functioning of the organism as a whole The role of insect hormones in reproduction diapause and the regulation of metabolism and behaviour is discussed The prospects for insect hormones as insecticides are also considered **Insect Endocrinology** Lawrence I. Gilbert, 2011-07-26 The publication of the extensive seven volume work Comprehensive Molecular Insect Science provided a complete reference encompassing important developments and achievements in modern insect science One of the most swiftly moving areas in entomological and comparative research is endocrinology and this volume Insect Endocrinology is designed for those who desire a comprehensive yet concise work on important aspects of this topic Because this area has moved quickly since the original publication articles in this new volume are revised highlighting developments in the related area since its original publication Insect Endocrinology covers the mechanism of action of insect hormones during growth and metamorphosis as well as the role of insect hormones in reproduction diapause and the regulation of metabolism Contents include articles on the juvenile hormones circadian organization of the endocrine system ecdysteroid chemistry and biochemistry as well as new chapters on insulin like peptides and the peptide hormone Bursicon This volume will be of great value to senior investigators graduate students post doctoral fellows and advanced undergraduate research students It can also be used as a reference for graduate courses and seminars on the topic Chapters will also be valuable to the applied biologist or entomologist providing the requisite understanding necessary for probing the more applied research areas Articles selected by the known and respected editor in chief of the original major reference work Comprehensive Molecular Insect Science Newly revised contributions bring together the latest research in the quickly moving field of insect endocrinology Review of the literature of the past five years is now included as well as full use of data arising from the application of molecular technologies wherever appropriate *Endocrinology of Insects* Roger G. H. Downer, Hans Laufer, 1983 *Insect Hormones* H. Frederik Nijhout, 2021-02-09 Although insect endocrinology is one of the oldest and most active branches of insect physiology its classic general texts are long out of date while its abundant primary literature

provides little biological context in which to make sense of the discipline as a whole In this book H Frederik Nijhout s goal is to provide a complete concise and up to date source for students and nonspecialists seeking an overview of the dynamic and wide ranging science that insect endocrinology has become since its beginnings nearly eighty years ago in the study of insect metamorphosis The author offers a comprehensive survey of the many roles that hormones play in the biology of insects Among the topics discussed are the control of molting metamorphosis reproduction caste determination in social insects diapause migration carbohydrate and lipid metabolism diuresis and behavior The account features a summary of the most current and accurate thinking on the complex roles of ecdysone and juvenile hormone in the control of metamorphosis a process still misunderstood and misrepresented in biological textbooks and many professional reviews Throughout the book s emphasis is on the biology of the organism and the ways in which physiological and developmental regulatory mechanisms are integrated into the insect s life cycle

Miller,2012-12-06 Insects as a group occupy a middle ground in the biosphere between bacteria and viruses at one extreme amphibians and mammals at the other The size and general nature of insects present special problems to the student of entomology For example many commercially available instruments are geared to measure in grams while the forces commonly encountered in studying insects are in the milligram range Therefore techniques for the study of insects or in those fields concerned with techniques developed in the control of insect pests are often unique Methods for measuring things are common to all sciences Advances sometimes depend more on how something was done than on what was measured indeed a given field often progresses from one technique to another as new methods are discovered developed and modified Just as often some of these techniques find their way into the classroom when the problems involved have been sufficiently ironed out to permit students to master the manipulations in a few laboratory periods Many specialized techniques are confined to one specific research laboratory Although methods may be considered commonplace where they are used in another context even the simplest procedures may save considerable time It is the purpose of this series 1 to report new developments in methodology 2 to reveal sources of groups who have dealt with and solved particular entomological problems and 3 to describe experiments which might be applicable for use in biology laboratory courses
