Mori, T. Mitsui, 2002-12-03 The 20th century saw tremendous achievements and progress in science and technology Undoubtedly computers and computer related technologies acted as one of vital catalysts for accelerating this progress in the latter half of the century The contributions of mathematical sciences have been equally profound and the synergy between mathematics and computer science has played a key role in accelerating the progress of both fields as well as science and engineering Mathematical sciences will undoubtedly continue to play this vital role in this new century In particular mathematical modeling and numerical simulation will continue to be among the essential methodologies for solving massive and complex problems that arise in science engineering and manufacturing Underpinning this all from a sound theoretical perspective will be numerical algorithms In recognition of this observation this volume focuses on the following specific topics 1 Fundamental numerical algorithms 2 Applications of numerical algorithms 3 Emerging technologies The articles included in this issue by experts on advanced scientific and engineering computations from numerous countries elucidate state of the art achievements in these three topics from various angles and suggest the future directions Although we cannot hope to cover all the aspects in scientific and engineering computations we hope that the articles will interest inform and inspire members of the science and engineering community **Chemical Engineering Computation with MATLAB®** Yeong Koo Yeo, 2017-08-01 Most problems encountered in chemical engineering are sophisticated and interdisciplinary Thus it is important for today's engineering students researchers and professionals to be proficient in the use of software tools for problem solving MATLAB is one such tool that is distinguished by the ability to perform calculations in vector matrix form a large library of built in functions strong structural language and a rich set of graphical visualization tools Furthermore MATLAB integrates computations visualization and programming in an intuitive user friendly environment Chemical Engineering Computation with MATLAB presents basic to advanced levels of problem solving techniques using MATLAB as the computation environment The book provides examples and problems extracted from core chemical engineering subject areas and presents a basic instruction in the use of MATLAB for problem solving It provides many examples and exercises and extensive problem solving instruction and solutions for various problems

Solutions are developed using fundamental principles to construct mathematical models and an equation oriented approach is used to generate numerical results A wealth of examples demonstrate the implementation of various problem solving approaches and methodologies for problem formulation problem solving analysis and presentation as well as visualization and documentation of results This book also provides aid with advanced problems that are often encountered in graduate research and industrial operations such as nonlinear regression parameter estimation in differential systems two point boundary value problems and partial differential equations and optimization **Engineering Computations** Joseph C. Computational Contact Mechanics Peter Wriggers, 2006-10-06 Contact mechanics has its application in many engineering problems No one can walk without frictional contact and no car would move for the same reason Hence contact mechanics has from an engineering point of view a long history beginning in ancient Egypt with the movement of large stone blocks over first experimental contributions from leading scientists like Leonardo da Vinci and Coulomb to today's computational methods In the past contact conditions were often modelled in engineering analysis by more simple boundary conditions since analytical solutions were not present for real world applications In such cases one investigated contact as a local problem using the stress and strain fields stemming from the analysis which was performed for the entire structure With the rapidly increasing power of modern computers more and more numerical simulations in engineering can include contact constraints directly which make the problems nonlinear This book is an account of the modern theory of nonlinear continuum mechanics and its application to contact problems as well as of modern simulation techniques for contact problems using the finite element method The latter includes a variety of discretization techniques for small and large deformation contact Algorithms play another prominent role when robust and efficient techniques have to be designed for contact simulations Finally adaptive methods based on error controlled finite element analysis and mesh adaptation techniques are of great interest for the reliable numerical solution of contact problems Modeling Complex Turbulent Flows Manuel D. Salas, Jerry N.

Hefner, Leonidas Sakell, 2012-12-06 Turbulence modeling both addresses a fundamental problem in physics the last great unsolved problem of classical physics and has far reaching importance in the solution of difficult practical problems from aeronautical engineering to dynamic meteorology However the growth of supercomputer facilities has recently caused an apparent shift in the focus of turbulence research from modeling to direct numerical simulation DNS and large eddy simulation LES This shift in emphasis comes at a time when claims are being made in the world around us that scientific analysis itself will shortly be transformed or replaced by a more powerful paradigm based on massive computations and sophisticated visualization Although this viewpoint has not lacked articulate and influential advocates these claims can at best only be judged premature After all as one computational researcher lamented the computer only does what I tell it to do and not what I want it to do In turbulence research the initial speculation that computational methods would replace not only model based computations but even experimental measurements have not come close to fulfillment It is becoming clear that computational methods and model development are equal partners in turbulence research DNS and LES remain valuable tools for suggesting and validating models while turbulence models continue to be the preferred tool for practical computations We believed that a symposium which would reaffirm the practical and scientific importance of turbulence modeling was both necessary and timely **Advances in Adaptive Computational Methods in Mechanics** P.

Ladeveze, J.T. Oden, 1998-06-23 Mastering modelling and in particular numerical models is becoming a crucial and central question in modern computational mechanics. Various tools able to quantify the quality of a model with regard to another one taken as the reference have been derived. Applied to computational strategies, these tools lead to new computational methods which are called adaptive. The present book is concerned with outlining the state of the art and the latest advances in both these important areas. Papers are selected from a Workshop Cachan 17-19 September 1997 which is the third of a series devoted to Error Estimators and Adaptivity in Computational Mechanics. The Cachan Workshop dealt with latest advances in adaptive computational methods in mechanics and their impacts on solving engineering problems. It was centered too on providing answers to simple questions such as what is being used or can be used at present to solve engineering problems. What should be the state of art in the year 2000? What are the new questions involving error estimators and their applications?
