**Transport Phenomena in Multiphase Systems** Hamid Arastoopour,Dimitri Gidaspow,Robert W. Lyczkowski,2021-08-21 This volume fills the need for a textbook presenting basic governing and constitutive equations followed by several engineering problems on multiphase flow and transport that are not provided in current advanced texts monographs or handbooks The unique emphasis of this book is on the sound formulation of the basic equations describing multiphase transport and how they can be used to design processes in selected industrially important fields The clear underlying mathematical and physical bases of the interdisciplinary description of multiphase flow and transport are the main themes along with advances in the kinetic theory for particle flow systems The book may be used as an upper level undergraduate or graduate textbook as a reference by professionals in the design of processes that deal with a

variety of multiphase systems and by practitioners and experts in multiphase science in the area of computational fluid dynamics CFD at U S national laboratories international universities research laboratories and institutions and in the chemical pharmaceutical and petroleum industries Distinct from other books on multiphase flow this volume shows clearly how the basic multiphase equations can be used in the design and scale up of multiphase processes The authors represent a combination of nearly two centuries of experience and innovative application of multiphase transport representing hundreds of publications and several books This book serves to encapsulate the essence of their wisdom and insight and

**Hemodynamics and Vascular Disease** Magnus Ziegler,2019-04-17 Blood vessels are more than simple pipes passively enabling blood to pass through them Their form and function are dynamic changing with both aging and disease This process involves a feedback loop wherein changes to the shape of a blood vessel affect the hemodynamics causing yet more structural adaptation This feedback loop is driven in part by the hemodynamic forces generated by the blood flow and the distribution and strength of these forces appear to play a role in the initiation progression severity and the outcome of vascular diseases Magnetic Resonance Imaging MRI offers a unique platform for investigating both the form and function of the vascular system The form of the vascular system can be examined using MR based angiography to generate detailed geometric

analyses or through quantitative techniques for measuring the composition of the vessel wall and atherosclerotic plaques To complement these analyses 4D Flow MRI can be used to quantify the functional aspect of the vascular system by generating a full time resolved three dimensional velocity field that represents the blood flow This thesis aims to develop and evaluate new methods for assessing vascular disease using novel hemodynamic markers generated from 4D Flow MRI and quantitative MRI data towards the larger goal of a more comprehensive non invasive examination oriented towards vascular disease In Paper I we developed and evaluated techniques to quantify flow stasis in abdominal aortic aneurysms to measure this under explored aspect of aneurysmal hemodynamics In Paper II the distribution and intensity of turbulence in the aorta was quantified in both younger and older men to understand how aging changes this aspect of hemodynamics A method to quantify the stresses generated by turbulence that act on the vessel wall was developed and evaluated using simulated flow data in Paper III and in Paper V this method was utilized to examine the wall stresses of the carotid artery The hemodynamics of vascular disease cannot be uncoupled from the anatomical changes the vessel wall undergoes and therefore Paper IV developed and evaluated a semi automatic method for quantifying several aspects of vessel wall composition These developments taken together help generate more valuable information from imaging data and can be pooled together with other methods to form a more comprehensive non invasive examination for vascular disease

**Activation, Metabolism and Perfusion of the Heart** S. Sideman, Rafael Beyar, 2012-12-06 The basic mechanism underlying directional differences in excitability conduction velocity and safety factor that lead to circus movement reentry in cardiac muscle is generally attributed to a spatial difference in the refractory period as originally described by Mines 1 or to a depressed segment as described by Schmitt and Erlanger 2 A departure from this depolarization in cardiac muscle involve quantities such as  $V_{max}$  that are not directly descriptive of the underlying mechanisms of propagation
