

The end of the ice age

© NewScientist

A small change in sunshine triggered a chain of events that led to the whole world warming by about 3.5°C

~20,000 years ago

A Changes in Earth's orbit lead to an increase in northern summer sunshine, melting the edges of the huge ice sheets in the north. Massive quantities of fresh water flood into the Atlantic.

~19,000 years ago

B The fresh water slows the Atlantic conveyor current, plunging the far north into a cold spell. The southern hemisphere, however, warms because ocean heat is no longer being carried north.

~17,500 years ago

C These changes push the band of westerly winds south, warming Antarctica, melting sea ice and stirring up the Southern Ocean. Deep waters rise to the surface and release long-trapped carbon dioxide.
