Endometrial Cancers:

Advances in prognosis and treatment of endometrial cancers Shannon Neville Westin, Marilyn Huang, 2023-01-03

Endometrial Cancer Earl A. Surwit, David Alberts, 2012-12-06 The incidence of endometrial cancer rose sharply in the United States in the early 1970s paralleling changes in the use of postmenopausal estrogens by American women A sizeable body of evidence supports the role of both excessive endogenous estrogen and exogenous estrogen in the etiology of endometrial cancer There is growing evidence that inadequate progesterone has the opposite effect in that progesterone supplementation of postmenopausal estrogen therapy reduces the incidence of endometrial cancer Despite this new awareness of the hormonal role that is played in carcinoma of the endometrium the disease still plagues the oncologist The general approach to carcinoma of the endometrium in the United States is that of primary surgical staging This provides the maximum amount of information to best plan postoperative radiation therapy and or chemotherapy for these patients In general patients who are considered candidates for surgical staging are those with advanced disease or high risk stage I endometrial carcinoma High risk endometrial carcinoma is defined as those patients with moderately differentiated lesions with deep myometrial invasion poorly differentiated carcinoma of the endometrium and the high risk histologies such as papillary carcinoma and clear cell carcinomas The surgical staging has extended in most institutions to patients with occult stage II carcinoma of the endometrium i e Endometrial Cancer Samir A. Farghaly, 2015 Endometrial cancer is the most common cancer of the female reproductive system with more than 49 500 United States women that are diagnosed with the disease each year It tends to develop after menopause when a woman is between the ages of 50 and 60 It is the sixth most common cancer in women worldwide fourteenth most common cancer overall with 320 000 new cases diagnosed in 2012 and it is the 13th most common cause of death from cancer with nearly 86 000 deaths worldwide Endometrial cancer occurs when cells of the endometrium undergo a transformation and begin to grow and multiply without the control mechanisms that normally limit their growth As the cells grow and multiply they form the cancerous lesion Cancerous tumors may encroach on and invade neighboring organs or lymph nodes or they may enter the bloodstream and spread to the bones or distant organs such as the lungs This process is called metastasis Metastatic tumors are the most aggressive and serious of all tumors Two main types of endometrial cancers exist Nearly all endometrial cancers are endometrial adenocarcinomas as they originate from glandular secreting tissue The other type of endometrial cancer uterine sarcomas originates in the connective tissue or muscle of the uterus A subtype of endometrial adenocarcinomas adenosquamous carcinoma includes squamous cells that is the type of cells found on the surface of the skin and cervix Other subtypes of endometrial adenocarcinomas are papillary serous adenocarcinomas and clear cell carcinomas Multidisciplinary teams of experts including specialists in medical oncology gynecologic oncology radiology urology radiotherapy and surgery are essential to utilize sophisticated imaging and laboratory tests to confirm the diagnosis and identify the characteristics of the tumor They

all work together to determine the best treatment approach for the patient Recent progress in the development of new surgical techniques has transformed the treatment of uterine cancer resulting in greater surgical precision and fewer complications In addition targeted adjuvant therapy has become useful in improving the oncologic outcome of patients with this disease Uterine Cancer Arlan F. Fuller,Michael V. Seiden,Robert Henry Young,2004 Presents an overview of the most frequently diagnosed gynecologic malignancy endometrial carcinoma as well as a collection of mesenchymal tumors Reviews epidemiology genetics diagnosis staging prognosis treatment postsurgical management and pathologic evaluation

Transforming Growth Factor-Beta in Cancer Therapy, Volume II Sonia B. Jakowlew,2010-01-01 Transforming Growth Factor B in Cancer Therapy Volume II Cancer Treatment and Therapy The chapters in this volume confer an abundance of knowledge about the current state of our understanding of transforming growth factor B TGF B in cancer treatment and therapy Unlike several more traditional positive polypeptide growth factors that stimulate cellular proliferation the prototypical TGF B is now known to

inhibit the growth of most normal cell types including those of epithelial and mesenchymal origin. However, there are examples of cell types that can be stimulated by TGF- β under certain conditions. TGF- β also induces the accumulation of matrix molecules by stimulating their synthesis as well as inhibiting their degradation. Moreover, TGF- β induces apoptosis of certain cell types, thereby restricting their proliferation. Overactivity of TGF- β has been linked to several diseases. For instance, the effect of TGF- β on matrix accumulation contributes to fibrotic conditions like glomerulonephritis, lung fibrosis, and liver cirrhosis. TGF- β has a very complicated role in cancer that is only beginning to be understood. Journal of the National Cancer Institute, 1999-10
