Hwang,Vincent T. Turitto,Michael R.T. Yen,2013-11-09 Advances of cardiovascular engineering prompt one to consider innovative device technology that is the development of new replacement heart valves or engineering of a totally implantable energy source for an artificial heart However these kinds of advances have often proved unable to achieve a long lasting benefit as the cardiovascular field has matured so fast Cardiovascular engineering has matured to the point where a major innovation must not only function but must continuously function better than existing devices This is difficult to accomplish in the complex cardiovascular system in which energy source biocompatibility compliance and functionality all must be considered The maturation of the field is evident from the fact that many engineered prosthetic systems perform well for example heart valves function for long periods of time large vessel vascular grafts are quite adequate extracorporeal membrane oxygenation has significantly prolonged the feasible length of heart bypass and other surgical operations and total artificial hearts can be used as a bridge to transplant without serious complications yet none of these systems is as good as the natural ones it replaces The reasons for this are many and incompletely understood The next stage of progress must be better to alterations understandings of the various components of vasculature and their response by our devices be they at the micro or macro circulatory levels in the blood or associated with the vascular wall    *The Biomedical Engineering Handbook* Joseph D.
