*Engineering Education* John Heywood, 2006-01-24 A synthesis of nearly 2 000 articles to help make engineers better educators While a significant body of knowledge has evolved in the field of engineering education over the years much of the published information has been restricted to scholarly journals and has not found a broad audience This publication rectifies that situation by reviewing the findings of nearly 2 000 scholarly articles to help engineers become better educators devise more effective curricula and be more effective leaders and advocates in curriculum and research development The author's first objective is to provide an illustrative review of research and development in engineering education since 1960 His second objective is with the examples given to encourage the practice of classroom assessment and research and his third objective is to promote the idea of curriculum leadership The publication is divided into four main parts Part I demonstrates how the underpinnings of education history philosophy psychology sociology determine the aims and objectives of the curriculum and the curriculum's internal structure which integrates assessment content teaching and learning Part II focuses on the curriculum itself considering such key issues as content organization trends and change A chapter on interdisciplinary and integrated study and a chapter on project and problem based models of curriculum are included Part III examines problem solving creativity and design Part IV delves into teaching assessment and evaluation beginning with a chapter on the lecture cooperative learning and teamwork The book ends with a brief insightful forecast of the future of engineering education Because this is a practical tool and reference for engineers each chapter is self contained and may be read independently of the others Unlike other works in engineering education which are generally intended for educational researchers this publication is written not only for researchers in the

field of engineering education but also for all engineers who teach All readers acquire a host of practical skills and knowledge in the fields of learning philosophy sociology and history as they specifically apply to the process of engineering curriculum improvement and evaluation

Recent Advances in Measuring and Controlling Synaptic Communication Jacopo Lamanna, Mattia Ferro, Emanuele Cocucci, 2023-11-10 Synapses represent a unique neuronal compartment specialized in communication The morpho functional investigation of the synapse has always been hindered by its tiny size and high density of molecular elements but specific technological and methodological advances helped us to reduce these limitations As the matter of fact in recent years we have witnessed the continuous development of new methods allowing measuring and controlling synaptic activation both in vitro and in vivo These include new genetically encoded

sensors of synaptic exocytosis but also engineered synaptic proteins able to inhibit the release of neurotransmitters. Furthermore, new promising tools allow changing the functional properties of synapses in a plasticity-like manner. All these methodological advances are likely to generate unprecedented knowledge about the dynamics of synaptic transmission and plasticity at several levels of the nervous system. Nevertheless, in most cases, the implementation of these new methods remains technically demanding, likely due to the high complexity of their operating principle. Hence, it would be worth refining and potentiating these tools in order to extend the range of experimental settings for their application. *Knowledge-Based Intelligent Information and Engineering Systems* Bruno Apolloni, 2007-08-30

The development and use of models of various objects is becoming a more common practice in recent days. This is due to the ease with which models can be developed and examined through the use of computers and appropriate software. Of those two, the former high-speed computers are easily accessible nowadays and the latter existing programs are being updated almost continuously and at the same time new powerful software is being developed. Usually, a model represents correlations between some processes and their interactions with better or worse quality of representation. It details and characterizes a part of the real world taking into account a structure of phenomena as well as quantitative and qualitative relations. There are a great variety of models. Modelling is carried out in many diverse fields. All types of natural phenomena in the area of biology, ecology and medicine are possible subjects for modelling. Models stand for and represent technical objects in physics, chemistry, engineering, social events and behaviours in sociology, financial matters, investments and stock markets in economy, strategy and tactics, defence, security and safety in military fields. There is one common point for all models: We expect them to fulfil the validity of prediction. It means that through the analysis of models, it is possible to predict phenomena which may occur in a fragment of the real world represented by a given model. We also expect to be able to predict future reactions to signals from the outside world.
