

SPECIES & ECOSYSTEM SURVIVAL

Every species plays a crucial role in the health and survival of its ecosystem. From food production to oxygen generation, pollination to seed dispersal, pest control, disease reduction, and waste recycling, each plant, animal and fungi is part of an intricate web of interconnected life.

Species roles are illustrated here using elephants as an example – a forest-type found across much of southern Africa.

1. **Food source** – Elephants eat over 100 different types of plants, including trees, shrubs and grasses. They are omnivores, but mostly eat plants. For example, elephant waste is used for fertilizer. Elephants eat bushes and grasses that humans and elephants may consider weeds. Elephants are important because they help to maintain habitats that support many other species.

2. **Waste disposal** – Elephants produce lots of waste, which includes their droppings. These droppings help disperse seeds of plants, helping them to grow. Elephants also help to spread seeds of plants by moving them around.

3. **Pest control** – Elephants have a healthy diet of predators that keep pest populations under control. For example, elephants eat termites and germs can reduce them. Amongst their predators are lions, leopards and crocodiles. Elephants also help to control the number of plants such as acacias and trees.

1. **Air & water** – Elephants breathe air and release oxygen that animals need to survive. When they urinate in their homes, sand and soil are carried on the tail and back. This reduces the amount of carbon dioxide entering the atmosphere and therefore helps reduce global warming. Elephants contribute to many processes by moving and reducing habitats, including hillsides and rapids.

2. **Food & fertilizer** – Elephants eat over 100 different types of plants, which is the basis of their diet. Elephants will eat almost anything like elephants and humans eat plants and they eat leaves from trees and shrubs.

3. **Waste disposal** – Elephants produce lots of waste, which includes their droppings. These droppings help disperse seeds of plants, helping them to grow. Elephants also help to spread seeds of plants by moving them around.

4. **Pest control** – Elephants have a healthy diet of predators that keep pest populations under control. For example, elephants eat termites and germs can reduce them. Amongst their predators are lions, leopards and crocodiles. Elephants also help to control the number of plants such as acacias and trees.

5. **Seed dispersal** – Elephants contribute to many processes by moving and reducing habitats, including hillsides and rapids. They move the parent plant.

Ecosystem Management ,1988 Program and abstracts of the conference **Ecosystem Management** ,1990
Ecosystem Management Mark S. Boyce,Alan W. Haney,1997-01-01 Until recently natural resource management of such commodities as timber and wildlife was driven largely by the desire to exploit these resources During the past three decades however ecologists have warned that this approach to natural resource management could have unforeseen consequences because it ignored how ecosystems function within the landscape Federal agencies that oversee forest and wildlife resources have begun to implement different schemes of ecosystem management schemes that vary enormously among agencies Contributors to this volume leading experts who are agency personnel as well as researchers now clarify the key elements of sound ecosystem management and offer prescriptions for implementing them The authors discuss definitions of ecosystem management sustainability of ecological systems landscape ecology resource management at different scales and in an ecosystem context new advances in computer technology that facilitate classification schemes for ecosystems ecosystem restoration biological diversity and public concerns Throughout the experts agree that management practices must be sustainable that production of commodities such amenities as recreation and aesthetics and biodiversity must not be allowed to decline over time *Ecosystem Management* Richard Sheppard Mitchell,Charles J. Serpentine Geoecology of Western North America Earl B. Alexander,Robert G. Coleman,Todd Keeler-Wolfe,Susan P. Harrison,2006-11-02 This book is about geology soils and plant communities in serpentine landscapes of western North America Aspects of the interaction of geology and soils reveal a fascinating symbiosis relating the structure composition and distribution of plant communities The plants that survive are a unique group There are some entire genera or even families of plants that are common throughout California that are poorly represented on serpentine while other genera are more diverse on serpentine than on other soils Serpentine rocks have dramatic effects on the vegetation that grows on them Many common plants cannot grow on serpentine soils leaving distinctive suites of plants to occupy serpentine habitats The floristic diversity associated with serpentine soils formed above ultramafic rocks is surprising considering that these soils are toxic to many plants Serpentine barrens of California often look like moonscapes but here we find numerous species of plants of low biomass that produce a richness of species rarely found in the world **Savannas, Barrens, and Rock Outcrop Plant Communities of North America** Roger C.
