Economics Of Protected Areas And Its Effect On Biodiversity:

Economics of Protected Areas and Its Effect on Biodiversity Ram Bir Singh Kushwah, 2001 With reference to India

Social and Economic Benefits of Protected Areas Marianne Kettunen, Patrick ten Brink, 2013-09-05 Protected areas PAs contain biodiversity and ecosystems of high conservation value. In addition, these areas provide a range of benefits both direct and indirect to our societies and economies i.e. so-called ecosystem services. These services include, for example, an ecosystem's ability to regulate floods and climate, purify water, secure the pollination of crops, and create opportunities for recreation, culture, and tourism. This book offers a comprehensive introduction to the socio-economic benefits of PAs and PA networks and provides step-by-step practical guidance on identifying, assessing, and valuing the various ecosystem services and related benefits provided by PAs. It also aims to improve the communication of PA benefits to different stakeholders and the general public. It is shown that identifying and valuing the socio-economic benefits of PAs can be beneficial for several reasons. Demonstrating socio-economic importance of a protected site can significantly increase political and stakeholder support for the site and resolve conflicts between different interest groups. This can lead to positive changes in policies and decision making. Insights on PA benefits are also needed to identify a combination of actions and land use practices that best support the sustainable and equitable utilisation of these benefits while retaining a site's conservation goals. Finally, demonstrating different benefits can help to discover alternative and sustainable sources for financing the management of PAs.

The Economics of Ecosystems and Biodiversity in National and International Policy Making Patrick ten Brink, 2012-09-10 The Economics of Ecosystems and Biodiversity (TEEB) study is a major international initiative drawing attention to local, national, and global economic benefits of biodiversity, to highlight the growing costs of biodiversity loss and ecosystem degradation, the benefits of investing in natural capital, and to draw together expertise from the fields of science, economics, and policy to enable practical actions. Drawing on a team of more than one hundred authors and reviewers, this book demonstrates the value of ecosystems and biodiversity to the economy, society, and individuals. It underlines the urgency of strategic policy making and action at national and international levels and presents a rich evidence base of policies and instruments in use around the world and a wide range of innovative solutions. It highlights the need for new public policy to reflect the appreciation that public goods and social benefits are often overlooked and that we need a transition to decision making which integrates the many values of nature across policy sectors. It explores the range of instruments to reward those offering ecosystem service benefits such as water provision and climate regulation. It looks at fiscal and regulatory instruments to reduce the incentives of those running down our natural capital and at reforming subsidies such that they respond to current and future priorities. The authors also consider two major areas of investment in natural capital: protected areas and investment in restoration. Overall, the book underlines the needs and ways to transform our approach to natural capital and demonstrates how we can practically take into account the value of ecosystems and biodiversity in policy.

Petrov, 2003 One of the cornerstones of life s wonders is the vast array of species filling the planet From plants to animals to humans there is no shortage of beings to provide spice of life variety is said to be Periodically scientists announce the discovery of a new form of life so it seems as if Earth is capable of producing new species just to keep us on our toes At times the immense breadth of living things can even feel overwhelming as one pauses to ponder how numerically insignificant humans are when compared to the insect population Given the biological diversity of the planet it is incumbent upon humans to safeguard the natural beauty of the environment To that end conservation takes on special importance necessitating the balancing of industrial expansion with preserving the flora and fauna surrounding us This book is an important tool in understanding and researching the many different life forms spanning the globe Collected here is a substantial and carefully selected listing of relevant literature on biological diversity and its conservation Following this bibliography are author title and subject indexes to allow for further access to this information The sheer bulk of the works about biological diversity can be so intimidating that a book such as this one becomes useful in sorting through the resources about the importance of life s variety **The Economics of Protected Marine Species: Concepts in Research and Management** Kristy Wallmo, Kathryn Bisack, Daniel K. Lew, Dale E. Squires, 2016-10-21 Protected marine species have populations that are depleted decreasing or are at risk of extinction or local extirpation As of 2015 The International Union for the Conservation of Nature a global environmental organization lists approximately 737 marine species worldwide that are considered at risk of extinction Many are provided legal protection through national laws requiring research and management measures aimed at recovering and maintaining the species at a sustainable population level Integral to the

policy decision process involving the management and recovery of marine species is the consideration of trade offs between the economic and ecological costs and benefits of protection This suggests that economics at its core the study of trade offs has a significant role In the U S a somewhat traditional use of economics in protected species research and management has involved cost minimization or cost effectiveness analyses to help select or prioritize conservation actions Economic research has also provided estimates of public non market benefits of recovering species which can be used in larger management frameworks such as ecosystem based management and coastal and marine spatial planning Inherent in much of this research however are complex biological and ecological relationships in which varying degrees of scientific uncertainty are present Addressing this type of uncertainty can affect the economic outcomes related to protected species For example recent work suggests that increasing scientific precision in biological sampling and models can greatly affect the magnitude of economic benefits to commercial fisheries while other research suggests that public non market benefits of species recovery are sensitive to uncertainty about baseline population estimates Previous research has illustrated the importance of understanding the biological ecological and economic aspects of protected species management and recovery In this research topic we synthesize current protected marine species economic research and expand the discussion on present and future challenges related to protected species economics The series of manuscripts brings together an array of prominent researchers and advances our understanding of the ecological and economic aspects of managing and recovering protected marine species

Specially Protected Marine Areas in the Exclusive Economic Zone (EEZ) Thomas Dux, 2011 This thesis examines the question of what States are legally empowered to do under international law when they seek to protect certain areas of their Exclusive Economic Zone EEZ In this context the regulation of shipping and other human activities under the Law of the Sea Convention and in particular the regime for special areas under Article 211 6 of the Convention are addressed Global and regional instruments containing mechanisms to protect specific areas are discussed and relevant State practice is considered with a view to possible implications on customary international law Finally guidance is given as to what States can practically do to protect specific areas of their EEZ for environmental reason Series Schriften zum See und Hafenrecht Vol 18

Environmental Policy Instruments for Conserving Global Biodiversity Oliver Deke,2008-03-29 If you can believe all things are possible to him who believes Mark 9 23 The current unprecedented loss of global biodiversity as a result of anthropo genic interference in the world s ecosystems is affecting human well being across the globe with increasing severity It therefore represents a major chal lenge in international environmental policymaking With the Convention on Biological Diversity CBD the community of states has recognized the in creasing importance of preserving biodiversity Given the extensive context of biodiversity loss and preservation this study focuses on two issues which are at the center of the public discussion regarding the objectives of conservation and the sustainable use of biodiversity and that are addressed by specific policy instruments The first issue is the regulation of cross border trade in genetic information and genetic resources Here the question is whether the commercial use of genetic information derived from bio diversity can create incentives for its preservation The second issue involves the conservation of biodiversity through the protection of ecologically valuable eco systems from human use Here the question is how the protection of these natu ral areas and the consequent restriction of destructive human use can be organized effectively on an international level I am very grateful to Professor Horst Siebert for offering valuable advice and support I also am indebted to Professor Till Requate for his helpful ideas and encouragement

Economic Development and Environmental Sustainability Ramón López,Michael A. Toman,2006-06-29 Economic growth as we know it today cannot persist indefinitely if it entails continuous degradation of natural resources and the environment While in a few countries around the world it appears that environmental degradation has been the result of rapid economic growth in the vast majority of the developing countries the environment has been equally spoiled despite slow or even

negative economic growth This book provides new insights on the common roots of economic stagnation poverty and environmental degradation which unfortunately generally reside in misguided government policies and priorities By doing this the volume seeks to provide a broader policy option framework than those found in conventional policy analyses mainly dominated by the Washington Consensus It shows that a major omission of the conventional view is that governments tend to allocate government expenditures in a biased way favouring subsidies to the economic elites to the detriment of investments in public goods including human capital R D as well as the development of institutions environmental and otherwise which are vital for long run growth poverty reduction and environmental sustainability
