Electromagnetic Sounding of the Earth's Interior 2nd edition provides a comprehensive up to date collection of contributions covering methodological computational and practical aspects of Electromagnetic sounding of the Earth by different techniques at global regional and local scales Moreover it contains new developments such as the concept of self consistent tasks of geophysics and 3 D interpretation of the TEM sounding which so far have not all been covered by one book

Electromagnetic Sounding of the Earth's Interior 2nd edition consists of three parts I EM sounding methods II Forward modelling and inversion techniques and III Data processing analysis modelling and interpretation The new edition includes brand new chapters on Pulse and frequency electromagnetic sounding for hydrocarbon offshore exploration Additionally all other chapters have been extensively updated to include new developments Presents recently developed methodological findings of the earth's study including seismoelectrical and renewed magnetovariational approaches Provides methodological guidelines for Electromagnetic data interpretation in various geological environments Contains a balanced set of lectures covering all aspects of Electromagnetic sounding at global regional and local levels along with case studies highlighting the practical importance of electromagnetic data Updates current findings in the field in particular MT magnetovariational and seismo electrical methods and the practice of 3D interpretations Electromagnetic Induction in the Earth and Moon Journal of Geomagnetism and Geoelectricity U. Rokityansky, 2012-12-06 Electrical conductivity is a parameter which characterizes composition and physical state of the Earth's interior Studies of the state equations of solids at high temperature and pressure indicate that there is a close relation between the electrical conductivity of rocks and temperature Therefore measurements of deep conductivity can provide knowledge of the present state and temperature of the Earth's crust and upper mantle matter Information about the temperature of the Earth's interior in the remote past is derived from heat flow data Experimental investigation of water containing rocks has revealed a pronounced increase of electrical conductivity in the temperature range D from 500 to 700 DC which may be attributed to the beginning of fractional melting Hence anomalies of electrical conductivity may be helpful in identifying zones of melting and dehydration The studies of these zones are perspective in the scientific research of the mobile areas of the Earth's crust and upper mantle where tectonic movements processes of the regional metamorphism and of forming mineral deposits are most intensive Thus in the whole set of research on physics of the Earth the studies of electrical conductivity of deep seated rocks appear beyond doubt very important *Electromagnetic Induction in the Earth and Moon* Akademii nauk SSSR.
